I am looking for a Cherokee CM-10 radio. I had mine in the
LONE STAR C.B. shop in Las Vegas NV. getting repaired
and the shop went belly up. Vina Beasley (the owner) left
a message saying she would return all left items but she never
returns calls. I quess I have lost it. It has been 4 months now.

1956. FS: Texas Star DX1600 W Fan Kit, Davemade M600, Teaberry Stalker IX

Newsgroup: rec.radio.cb
Date: 2000-07-12 00:00:00 UTC
From: mobile51@aol.com
Message-ID: <20000712175630.19546.00000522@ng-mb1.aol.com>
Source record: 43936

This Sweet Sixteen is a beauty. Had a little dust on it, but original owner kept it in great condition.
He made a remote control and deluxe three fan kit for it out of aluminum as well. After a little checking, I found it has all the original capacitors intact as well. Board is shiny as new. I bought it to use and decided to go with a smaller unit instead. Has original instruction sheet with schematic to build remote. First $450 gets it.

Also I have a new(talked on once) Davemade M600. I will sell it for $350. It is is excellent condition appearance and mechanically also.

I also have a Teaberry Stalker IX, export radio with AM,FM,USB,LSB. This unit is a real talker, but has some scratches around the chrome. On a scale of 10, it is a 5 or so appearance-wise, but will get your name called constantly. In 1985, I remember paying $200 for one of these. Yes it has extra channels on the ANL/NB switches. New Bracket, no Mic. uses 4 pin.... $60 bucks
Thanks for reading....

No, it's drunks, driving cell phone users and other assholes that
have turned me off of driving. When they stop risking my life on the
highways I may love driving again, I don't see that happening though,
the U.S.A.'s penalties are so goddamn lame we'll never solve these
problems. You seem very upset, you probably are one of those who gab
while driving...

I guess you don't have the Sylvania brand 6KV6A tubes in new condition though. I wrote you awhile back and asked for only Sylvania brand and only 6KV6A type tubes and you wanted to sub. some other brands and numbers for me. I told you I only wanted the Sylvania brand and only the 6KV6A and you never got back with me. I took it that this ment you could not supply this particular tube in this particular brand. If you can please let me know. Thanks!

1980. Antron 99 recall - they must be joking...

Newsgroup: rec.radio.cb
Date: 2000-07-12 00:00:00 UTC
From: Paddler <eremington@losch.net>
Message-ID: <1uab5.104$h%5.13785@news-east.usenetserver.com>
Source record: 44010

"Antron Antenna Research & Electronics Recalls Omnidirectional CB Base Station Antenna
WASHINGTON, DC -- In cooperation with the U.S. Consumer Product Safety Commission, Antron Antenna Research t Electronics, Holland, Ohio is voluntarily recalling its Antron Model,"99" omnidirectional CB base station antennas. If contact is made by the antennas with an electrical power line while being installed or taken down, the antennas have the potential for severe or fatal shock.

The CPSC stated that in tests conducted on the Model "99", it failed to comply with the agency's mandatory safety standard. The standard is intended to reduce the electrocution hazard if the antenna should accidentally contact a power line while being removed or installed.

The CPSC is not aware of any injuries or deaths involving the Antron "99" omnidirectional CB base station antennas. However, during the 5 year period prior to the CPSC's safety standard, and estimated 450 CB antenna related electrocutions occurred as a result of the antennas being put up or taken down. Electrocution deaths continue to occur each year from CB antennas which fail to comply with the standard.

Antron Antenna Research f Electronics distributed approximately 100 of the affected antennas nationwide. The Model, and Company name appear on the shipping carton, instruction sheet and antenna. Retailers who still have these antennas in stock should return them to Antron Antenna Research & Electronics immediately for refund. Consumers owning any of these antennas which have not been installed should return them to the dealer for a full refund. Consumers who have already installed antennas should leave them alone. These persons can obtain a warning sticker label/hang tag to be placed in a conspicuous location on the product to warn future users about the potential hazard. The sticker label/hang tag can be obtained by calling Antron Antenna Research & Electronics at 419-865-5877 or writing the firm at 7134 Railroad St., Holland, Ohio 43528. As a normal practice, individuals planning to install or take down a CB antenna should first contact their local power company for advice if overhead-wires pass through the neighborhood.

Additional information concerning this recall is also available to consumers by calling the CPSC toll-free hotline number at 800-638-CPSC. A teletypewriter number for the hearing impaired is 800-638-8270".

He did not run the antennas in tyler likes BB runs, he only ran 4 sticks, learn the facts dude. I seen them, and unless you were in tyler to see them as well be quite about tyler, you guys act like hot springs was a big deal, there was only a small hand full of people in the DC classes in Hot Springs, It was a small keydown comparied to tyler, at least a 1/4 of the size.

Hello Landshark: Roger that. I got to run over to Miss Dinah's fillin
station, and get gas. I like to set in the shade of the Ukalipitus
Tress's
and have a soda or cold beer, and watch the cars on 14.

Sometimes a few of the local CB'ers meet there and have a few, and tell
lies, about fishin and shootin skip. There's ah gonna be a get together
tomorrow at Miss Dinah's place. One of the boys whats to show off a new
8 pill amp. But he says the amp ain't working right. I told him to
remove the too small 10 gauge wire, and install the good 2 gauge welding
type wire off the battery. It will be a good one I'll bet! Hope they
don't get all liquored up, and start howling and ah yodeling on the
radio.

Jay in the Great Mojave Desert, ...just down the road ah ways from the
fillin station.

yes, our club has a one day seminar and a testing at the end of
the day....but I think a little study ahead of time will prepare
you much better for the test....you'll know what questians to
ask at the seminar to help you understand things better....so I
always tell them 2 weeks... and 4 weeks if you do the code.

why does it say in my booklet that if you have a HAM license, its alright to run an amp?

Your misinterpreting what it says. It's still illegal to use
an amplifier on 11 meters. It is illegal to possess an amplifier
for use in the CB band -unless- you hold a license in another
service that does allow use of an amplifier. (Before the rest of
you have a 'cat' over that, it's the common interpretation, not
necessarily mine.)

I guess if all the person wants to do is get the ticket and not
actually learn, it will work..... We also have a local group who teaches
"how to pass the test".... Then later you can listen to this same group
on the local repeaters whining about the ones they just tested and how they
are nothing but a "new breed of CBer".... So if all you want is the paper
go ahead and do it! I think you'll be missing out by doing it that way,
however you won't be the Lone Ranger.... I know a pretty good number of
General-Extra class operators that are lost if you start talking theory!
If you ask them why it is that they cannot answer theory questions from the
Tech pool, they answer by telling you that they memorized the correct
answers and don't have a clue as to actual theory.....

Without knowing more about how the antenna is/will be mounted,
I can't really make a suggestion. Simplest would be three or
four 9 foot wires running horizontally from the base of the
antenna. But there's almost always more than one way of doing
it.

In actual practice, possession of an 11M amplifier is considered
evidence
of use if you also own a CB.

However, if you have an 11M amp, and you have a HAM license (which
technically is the ONLY license that would allow that thing to be used,
and then only on 10M (ok, ok, you might use it on 12, but I don't know
anyone who does...) then possession is not presumption of use.

It does NOT and NO WAY allow you to use that amp illegally. It just
prevents the POSSESSION of that equipment from be evidence of
illegal use.

And it actually makes sense. As a HAM, you could be expected to know
how to actually build your equipment. You can legally buy commercial
gear to scrounge parts, or to modify for use on HAM bands. Really,
what is the distinction of buying a part, or buying a parts radio, or
buying
a radio? Same thing with an amp. Buy the transisitor to build an amp
for 10M. Or buy an amp to rip the transistor out of to build your 10m
amp. Or buy an amp to just align to work on 10M. You can't legally
draw a line between the choices, so they don't.

Now, I'm not saying it's right or wrong... But I do have some
misgivings
about a law that says 'possession' is legally considered evidence of
illegal use... Especially since that very same 'possession' is legal
for
some and not for others.

Sorry wrong... Possession of an 11M amplification device and possession
of CB equipment, even if not hooked together, is legally considered
evidence of use unless the individual has a HAM license.

I'm not saying it's right, but that's the way it is.

I'm not saying it makes sense, but that's the way it is.

I'm not saying it's enforced other than extremely rarely, but yes,
that's
the way it is.

I believe that was in the September (maybe a few months off) 1980
issue of Car and Driver. The 'header' of the article showed an old
Buick speedometer that went ...35-45-55-55-55-55-55....

Yes, the jammer article was interesting, and it really showed how
radar operated. What the article DIDN'T say was how the guns
DETECTED this mode of jamming.... (Most actually didn't at that
time. Within a few years though, almost all the guns had 'jam'
indicators of some kind. Also, if the officer 'turned on' the monitor,
and turned off the beam, he'd still hear a raspy tone. DEFINATE
indication of jamming!!)

They also ran an article a couple of months either before or after that
called 'Radar Range' where they measured the effectiveness of a
Kustom Signals KR11 (the primo radar gun at the time) against
various vehicles.

****
Wrong! You said that an SWR meter reads the mismatch between
the feed line and antenna. That's where the 'remote' point
comes
in. It's on the other end of the feed line from the SWR
meter, I
have to think that's a 'remote' point as far as the meter is
concerned. You brought it up, now explain how it works!
****
> I proved that changing the impedance of the output of the
> transmitter did not change the SWR as that is a function of the match at the remote
> point and has nothing to do with the source impedance. A mismatch of the source
> impedance and feedline effects the energy transfer but not the SWR on the line.
****
You didn't prove anything, because you never changed the
output
impedance of the 'source'! If you think the 'Load' or 'Plate'
controls can change output impedance, your an idiot, and you've
proved that by the results of your experiment.

An SWR meter has to compare some impedance to the antenna
system
impedance to come up with an SWR reading. If it isn't
comparing
the 'source' impedance on the input of the meter, with the
antenna
system impedance on the output of the meter, just exactly what
is
the SWR meter comparing?

First off, the amp must be 'linear' for AM and SSB use. Non linear amps? Well, they are called Class C for example, and they are non-linear because the output doesn't follow the input 100%. Class C means the transisitor is biased off part of signal. Why in the world would someone build something like this? Well, if the most efficient type of amp, and it works just fine for "FM" signals when filtered correctly.

As to AM vs SSB, remember that SSB doesn't have any 'carrier'. So if you key an amp with AM, the amp detects that and 'turns on'. When you unkey, it turns off or back to receive. On SSB with no carrier, the amp detects the signal the first signal that comes out of the radio (it generally has to be FAST or it could clip off the first fraction of a second, even a whole word or two). But, what about spaces between words? Amps for AM might not handle that, and would 'drop back to receive' on spaces between words or other pauses. SSB amps on the other hand have a circuit that 'attacks' fast to change from receive to transmit, but they 'pause' when it's time to 'release' and switch back to receive. Fast attack, slow release, are what you want for SSB.

I have to agree. I took a basic course that took one night a week for 21/2
mos. We went through the book and into each subject. It was fairly through
but not indepth. If you plan on getting your advance qualifications it
helps. The weekend/one day course shouldn't be allowed it defeats the
purpose.

> these voltages produced?)

The chunk of my post you conveniently lopped off
explained that. An SWR meter compares what is con-
nected to its output connector to a 50 ohm (constant)
internal line section. The source supplies an RF
signal. The source impedance is irrelevant. The
source signal amplitude can be compensated for
through the calibration of the meter. The source
signal purity (if poor) can effect the meter reading
in such a way as to fool you into believing the
source impedance has an effect--when in fact it
does not.

> 'Doc
>
> PS - I can think of a simple experiment to show that an SWR
> meter is not 50 ohms impedance dependent, but it
> requires
> two 2:1 'unun' baluns.

I don't believe that SWR meters are 50 ohm impedance
dependant. The input (source) impedance can be anything,
and the output (load) impedance is what is compared to
the internal 50 ohm line section impedance.

Years ago, in the early days of SWR meters, 75 ohm
SWR meters were fairly common. They always carried
a warning not to use them in 50 ohm systems because
you'd get erroneous readings. 75 ohm SWR meters
compare the load impedance to an internal 75 ohm
(constant) line section. Again, the source impedance
is irrelevant. The source simply provides a signal
at a certain frequency.

Go to the library and take a look at some old radio
handbooks that describe SWR meters. I guarantee
you'll see the warnings about using an SWR meter
with the right design impedance for the system
you're working with.

> I don't have any of those and I
> really don't think many people do. Do you happen to
> have
> two of them, or are you willing to make them? I can't
> think
> of an easy way of changing the impedance of the radio,
> without
> taking a chance of harming the radio. That's why I'd
> use
> the two unbalanced to unbalanced 'baluns'.

Let's keep it simple. The load should be a purely
resistive 50 ohms (a dummy load and any length of
50 ohm coax). Connect the SWR meter as close to
the source (radio or amp) as is convenient. The
purity of the source signal shouldn't be in question.
In other words, any spurious emissions should be at
least 30 dB below the fundamental at any point in the
test. That dictates the use of a radio or an amp
with a tuned output.

Now, you describe to me what to do to vary the
source impedance so that the SWR meter reading
will change. A change of source impedance that
causes an SWR reading of 2:1 will prove your
point but will not damage the source. The SWR
at the start of the test will be 1:1. My belief
is that there's nothing you can have me do that
will make the SWR reading change that doesn't
drastically decrease the purity of the source
signal.

SWR meters compare the output load to a design constant impedance.
I agree that it doesn't have to be done using a piece of coax, but
one way or another it's there. Look at any SWR meter design and
you'll find it. It's either in the meter itself or in the remote
pick-up unit.

Well, you made me do it--go to their web page and clip the relevant information. Buckaroo, you could have done the same thing without all this fuss, but then I gather you are a teenager, and of course by default you know it all. Like it's been said for years, "people who think they know it all are particularly irritating to those of us do."

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart D--Citizens Band (CB) Radio Service

Sec. 95.410 (CB Rule 10) How much power may I use?

(a) Your CB station transmitter power output must not exceed the following values under any conditions:

AM (A3)--4 watts (carrier power) SSB--12 watts (peak envelope power)

(b) If you need more information about the power rule, see the technical rules in subpart E of part 95.
(c) Use of a transmitter which has carrier or peak envelope power in

excess of that authorized voids your authority to operate the station.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called

linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a

signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF

power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external

RF power amplifier.

[48 FR 24894, June 3, 1983, as amended at 63 FR 36610, July 7, 1998]

Effective Date Note: At 63 FR 36610, July 7, 1998, Sec. 95.411, paragraph (a) introductory text was amended by removing the term ``type-accepted'' and adding in its place ``certificated'', effective Oct. 5, 1998.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external RF power amplifier.

[48 FR 24894, June 3, 1983, as amended at 63 FR 36610, July 7, 1998]

Hi, I am selling a Silver Streak 350 Amp. It puts out about 350 watts. I used it for about a year, then took it out of my truck. It has a few scratches on it. It comes with a moblie mount and has a preamp and SSB capabilities. This amp really sounds great. I am wanting to sell it, cuz I've got my eye on a beautiful screwdriver antenna. I am asking about $245 for the amp. Please e-mail me for the details and info.

I figured you could disconnect the tuned circuit
from the final stage and couple into it using an
antenna analyzer configured like a grid dip meter
(or a network analyzer). The problem with that
method might be that you'd end up measuring the
output impedance of the device(s) in the final
stage (the input impedance to the matching net-
work) rather than the output impedance of the
matching network. It would probably be better
to do it the way you describe.

Thanks.

Why would a company say something that isn't true? Man! You mean to say you have never seen those ads for an Antron 99 that claim 9.9 db? (NOT dbi) For the most part, the majority of manufacturers exaggerate their products performance or just outright lie. This is the norm, not the exception.

>
> - Anonymous

The antenna should be electrically isolated from
the pole if the pole is metal.

The coax center conductor should be connected to
the 102" whip. Unless he uses channels above
Channel 40 alot, he should add 6 inches to the
antenna (a spring at the bottom or a piece of
stiff wire at the top).

Within a few inches of the mount, the coax shield
should be connected to at least three 9 foot wires
that run away from the antenna at about a 45 degree
angle below horizontal (toward the ground) and 120
degrees apart (around the antenna). The 3 wires
form a "ground plane" around the antenna and should
be electrically isolated from the vertical part of
the antenna (aka the radiator). The 3 wires are
called "radials." Adjust the length and the angle
of the radials below horizontal for the lowest SWR.
You can also adjust the length of the radiator for
lowest SWR *after* you've done the best you can with
ground plane adjustments.

What you're doing is making what's called a quarterwave
groundplane type of antenna. It and the dipole are
the 2 most common antennas. Any radio book you can
lay your hands on will describe and have pictures of
do-it-yourself quarterwave groundplane antennas. If
what I wrote above doesn't make sense, go to a local
library or bookstore and read whatever you can find
that pertains to the quarterwave groundplane antenna.

Good luck and have fun.

If you didn't have a life or common sense, and you had a ton of money and a whole lot of time, you could most likely have this ridicules regulation over turned in court . It's almost as stupid as being illegal to resale a 23 channel radio.
I wonder sometimes if that is why it is only enforced in extreme cases only. Could you imagine the large class action suit, if say 10% of amp users banded together?

I would like to know what ham book you read that. It is absolutely incorrect. Even if one holds a ham license, when operating on 11 meters you bound by the same 11 meter rules as anyone. Holding a ham license does not make it legal to operate an amp that exceeds the legal power limits on 11 meters.

Greetings!

On Mon, 10 Jul 2000 23:55:00 -0400, while the modem was pondering it's
navel, tnom@mucks.net dissertated the following:

>I came upon a this piece of information.....
>If you keep the original proportion of an object, and DOUBLE the
>height, the weight will go up by a factor of eight.
>
>The above statement conflicts with this.....
>In order to DOUBLE the distance in free space, the RF power
>will have to quadruple.
>
>Question: Both the object and the radiated RF field are three
>dimensional. Why is the math different between them?
>

One is dealing with a point source. It's dimension never changes, only
it's relative height to an object like the earth [e.g. ground losses].

Since physical is one aspect of the 3-d world. We are really talking
out a spacial object using EMF. This is where the rules of the
physical don't alway apply to the issue of emissive properties.

Since we're talking emission - we have to consider the EMF wave as a
point source. It's a form of radiation - only using EMF.

This is why the square law of distance traveled applies.

> you use to determine source (generator) impedance?

A direct measurement is almost impossible for a transmitter.
I would create a tunable matching circuit and a good 50 ohm
dummy load. Attach this to the radio and transmit into it.
Tune the matching circuit for maximum voltage (power) on
the 50 ohm load. Then remove the matching circuit/load and
measure that with an antenna analyzer or network analyzer
(don't forget to stop transmitting first ;-D).
Its impedance will be the complex conjugate of the transmitter
output impedance.

That is generally not an issue since the most commonly used
radar "bands" are actually individual frequencies.
X "band" is 10.525 GHz and K "band" is 24.150 GHz.
These are the only two frequencies allowed for use by radar guns
in those "bands."

Also, the radar detector detects a direct signal from the transmitter.
The radar gun has to detect a signal reflected off of the target.
Not only does that signal travel twice as far, only a tiny fraction
of it gets reflected. In terms of sensitivity, a radar detector
has a huge advantage over a radar gun.

Detecting the difference frequency is almost trivial. The transmitted
signal is also the receiver local oscillator. It is mixed with the
received signal by a microwave diode and the difference frequency
(in the audio band) is available directly.

The 33 Hz per MPH figure is at X band (10.525 GHz). At K band (24.150
GHz), the shift is proportionally higher (something like 76 Hz per MPH).

I believe my original post said that I used a jumper on the relay. I am testing the entire circuit, If I take the jumper off yes I have a near flat match with dummy load.

KRS

I am a newbie to cb radio operation. Over the air I have heard some people say things like 535 North Carolina (for example). In the forum I see people do that ass well (some in this newsgroup say: North Georgia Buckaroo "223"). What are those 3 digit numbers? What do they represent? I understand what the state location and callsigns are about.Thank you

It's nothing more than a made-up identification that some guys use--perhaps a house number, car license number, birth date, or the price of gas at the filling station.

KW,
You are absolutely right about the non-technical hams! I have been building multiband mobile antennas for several years now, and I was, at first, amazed at the number of "Extra" Class hams who knew absolutely nothing! I built and sold a couple mobile antennas to hams who promptly brought them back saying they didn't work. That was not true--they were clueless about how to install and resonate an antenna! They knew ZIP about impedance, reactance, antenna currents, coil losses, or correct coax. One had been trimming coax in hopes of "tuning" his antenna! While I welcome anyone to the hobby, I am afraid that I am not so happy about the "Appliance Operators" who only want to jabber and not learn anything. That is the thing that excites me about ham radio. It's an education in itself if you let it be.

Your the idiot, why do you think the output of the pi-section tank circuit is adjustable? So it can match a range of impedance's. Here is a direct quote from the transmitter manual. "The final tank consists of an impedance matching network with two separate controls located on the front panel, one for tuning and one for loading."
Notice the key words there doc, "impedance matching network", that means the tank circuit can be adjusted to match a range of impedance's. Hell, you don't even know how much audio power is required to 100% modulate an AM carrier, a simple concept so why should anyone think you know about anything more complicated like SWR and impedance matching? So where is the idiot, maybe you should look in a mirror.

Buckaroo,

It does not matter WHAT that book says--it is still illegal for ANYONE to use an amp on 11 meters. A ham cannot even use his callsign on 11 meters. All you gotta do is go to www.rainreport.com and read/listen to the letters. There are hams who have gotten "busted" for just this sort of thing. The author of that book is, undoubtedly misinformed.

I know it "galls" some people that hams can use amps and CB ops can't. The simple logic is that a licensed ham, by virtue of the study that earned him his ticket, is supposed--and that can be academic-----to understand how and when to use one. The rule for amps is, while there are no absolutes, that one must use only the power necessary to estab-lish and maintain communications. If you can run a QSO with 50 watts, you should do it, if it takes 100 watts, then do it, and if, because of atmospherics and QRM, the ham must use more, then he may use up to 1500 watts if his license permits. Unfortunately, many people, like on CB, want to be King Of the Hill, and run the max all the time. This only makes it hard for others who share the bands and don't have that kind of power. I have the license (Advanced), but I have NEVER used that much power because I have been able to work anywhere I wanted with much less. I do have a 500 watt amp on mobile, and that's only because a mobile is at a disadvantage to start with, and then I only use it if it is nec-essary. If I were to run that amp on CB, I would likely get nailed! So I don't do it. I like my license too much.

> meter,

If it doesn't read the mismatch of the feed point of the feedline and antenna (which is what causes SWR) then just what is it measuring?

>I have to think that's a 'remote' point as far as the meter is concerned.

So what, the meter is just reading the forward and reflected waves, it doesn't care if it is at the feed point or at some length away.

No... if you plan on working the SSB mode your amp will reqire some bias
(usually class AB) to avoid a slight audio distortion during the rising
signal.

I here alot of CBers calling themselves "the Big Boys" or "bullies". Does that have any signifigance? Are they using powerful amps to bust thru the airwaves or something?
No I am thinking about getting an amp, can I find one in a CB shop and legally buy it and get it tuned there?

Also Buckaroo, if you are reading this, what part of North Georgia are you in (city or county)? And is anyone here in North Carolina?

Thanks again guys.

I agree that a certain new element has been introduced to the ham tickets. I also agree that the majority of the new licensees want to jabber more than learn anything. I don't necessarily think that is a bad idea. I look at it this way, ham radio has evolved into a hobby more than a service. The requirements for a license was holding back potential "appliance ops" who don't want to do anything but talk and if they have to really learn, forget it. But that was ok because the hams who recognized that the service was in dire need of change if it was to attract and survive made the necessary adjustmets. (reducing code requirements) Also, if the ham community continued to decline in numbers as prior years indicated, it very well could be in danger of much worse than the "dumbing down" the licensing structure. So in an ironic way, the hams should be grateful to the influx of new arrivals. Like it or not, TALKING on ham radio is what the new licensees want to do, not understand or learn HOW or WHY they work. It has evolved into a hobby with a novel medium of communication. The stated above does not necessarily reflect my personal opinion, but rather what I have observed. My personal opinion is they should have eliminated code (as a requirement) altogether when the US officially stopped monitoring for it. Not taking into consideration the rest of the testing elements, code has officially outlived it's usefulness. The backlash over this subject seems to be exclusively from the hams who feel "I had to do it and so should you" and the ones who refuse to accept that ham radio is being recognized by the majority of newcomers as a novel hobby, nothing more, nothing less.

> illegal, now and always.
>

Your WRONG!!! Gary.

In the early dayz of CB Radio, channel 23 was used in two different Citizens Band classes, and the other service allowed for 25 watts output, thereby legalizing linear amps.

I have the catalog from Allied Radio to prove that.

You need to check the SWR between the radio and the amp. You will probably find that a match box in this section of coax will help eliminate your squeal problem. I have found that there are plenty of boxes and radios that just need to be "matched up either by playing with coax lengths or by adding a match box to "trick" it into seeing the right standing wave.

2093. Re: 50 ohm's ?

Newsgroup: rec.radio.cb
Date: 2000-07-13 00:00:00 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <396E726B.D31E96BE@oio.net>
Source record: 44073

Bill,
First, there is not internal 50 ohm coax section that the SWR meter uses for comparison. Take the back off of a Radio Shack SWR meter, or an Auteh Research meter, or any other 'Wheatstone Bridge' type SWR meter. Do you see any piece of coax in there? No, you don't! So if SWR meters work as you suggest, what do these meters use for comparison? Remember, there is no coax inside of them!
As I said before, an SWR meter uses what is on the input of the meter and compares it to what's on the output of the meter. Take your own suggestion and do some reading.
Or, here's another way of looking at it that bares directly on what the meter does, read forward and reflected voltages. The meter 'sees' the forward voltage coming from the transmitter, it 'sees' the reflected voltage coming from the antenna. It compares these two voltages, and the relationship of these voltages is the same as the relationship of the transmitter impedance and the antenna impedance. This relationship is expressed as a ratio, and is called Standing Wave Ratio.
I give up. You have not changed my mind, and won't when I know I'm right. But, I'm tired of beating my head against an idiot. The only thing I regret is that you're to 'set' in in your ways to listen. It's a shame that some people will believe you.
'Doc

Twisted, I agree with much of what your saying, Especially the code requirement, It kept me from getting a licensed for a good portion of my life, I planned on not bothering with code and staying put at Tech, But I changed my mind and a month later I did the 5,13,and 20 WPM all the same day... Then shortly after that the talk of dropping code requirements came out... at that time and currently I feel the code requirements were archaic and of little use.... However I also feel that to make up for lack of Code that the Testing should be more stringent.. New Hams are a good thing, If the service continues to stagnate we could well lose more large pieces of the radio spectrum to commercial interests..... However I do feel that Technical ability, operating etiquette, and courtesy should be strictly enforced! I don't think that leaning to pass the test is in the best interests of the service.... I feel in the long run it could be just as damaging as a lack of "new blood"... These are simply my opinions, hopefully no one will get there undies in a bundle over it!

I believe he refers to RC, which of course stands for Remote Control...
Sorry to say it Toll your wrong, Class D CB has NEVER ALLOWED Amplifiers,
The CB you refer to was strictly controlled, Remote control, it allowed
absolutely NO voice communications! You are right in saying that 25 watts
input was allowed, however it was not for communications, or voice... And
allowed no External RF Amplifiers, it was limited to 25 watt input RC
Transmitters on a crystal controlled basis, it also required a special
license, Regular CB license did not cover it..... Although way back
before CB 11 meters did allow amplifiers and higher RF levels....

I use a maco v-quad and I am on the super bowl everyday and
every day I compete with MUCH,MUCH bigger beams and in alot of
cases I come out on top. I would buy a v-quad if I was you!!!
You will be very, very happy with the performance of this
antenna. And if you do get it, run it in the vertical and
horiz. position being that you can only run it horiz. or both
because it is single polarity.. I love this antenna!! Check
out my web site to view my v-quad. www.angelfire.com/ri/theboss

Yea, stricter testing might take care of plenty of things. The problem is everyone today wants that instant gratification. Noone wants to work for anything. If someone is interested in ham radio they will more than likely take it upon themselves to learn the finer aspects of it. I think eventually it might go the way of the old cb licensing, a fee and thats it. With the advent of technology in communications today, it may be the only thing that preserves it. Sad, 'cause the ol timers (most of 'em anyhow) bring a certain dignity to the bands that is lacking in new ops today. But I know more than a few old timers around here that got out when the restructuring took place.

Source record: 44101

Hello all, This post is basically a survey, I would like to know what kind of dead key & swing values are being put out by other Tram radios, (for example) on my D201 I get a 15 watt dead key, with a 30 watt pep. On my D201A, im getting a stock 4 watts dead key, and a 32 watt pep. I basically want to know what other Tram users are consistently seeing coming out of their radios.......Both of my D201 radios are amazingly good in the audio catagory, as well as receive, But ive never seen anything near these pep values coming out of ANY other vintage radios, (Including Brownings).....thanks for your opinions, Frank.

I was looking at the Jo Gunn page and I'm baffled by their specs. For instance their Smokin Gunn II claims 12db at 28X and the Skip Jack 12.5db at 25X. The claim that the lower gain of the two produces more multiplication makes no sense to me. Which is the better antenna? Thanks in advance for comments or suggestions.

As long as we're at it.... On the older radar units, when you
'calibrate'
them, all you were doing was adjusting a 'time base' for a counter.
It just counted the pulses (the 'audio') and by selecting the right time
base, you get the MPH.

A lot of the older units also had a 'monitor' function for the officer
to
actually listen to the audio, and there should be a tone that 'drops' as
the vehicle exits the beam. In at least one jurisdiction I know of, it
was department policy that the officer HAD to be listening to the
tone, otherwise how was it certain that the radar had picked up a
specific vehicle? Remember, a vehicle like a White Freightliner
at 7000 YARDS has more reflected radar signal than most American
mid-sized sedans at less than 1000 feet.

If the line is flat, (1.5 to 1 or less is considered flat) the line can be any length. It does not have to be an multiple of an electrical 1/2 wave length to get an accurate reading. You keep talking apples and oranges. The object was to prove that a change in the source impedance would not change the SWR, now your talking about the remote point. I proved that changing the impedance of the output of the transmitter did not change the SWR as that is a function of the match at the remote point and has nothing to do with the source impedance. A mismatch of the source impedance and feedline effects the energy transfer but not the SWR on the line.

Go pick it up again and reread it. Amps have never been legal for CB. Do you need for me to clip the section of Part 95 that states the obvious and post it here? Nobody else will appreciate it very much.

When I got my Uniden washington about a year ago. it came with a Part 95 booklet and if you read all of cb rule 11 it plain out says "anyone who has possession of RF power device, that holds a license in another radio service which allows you to operate an externel RF power amplifier".

That has only been a year ago since i bought that thing, so i wouldnt think they would change a rule that soon.

..... I seem to remember an article in 'Car & Driver' years ago, where they built a radar frequency transmitter.... it would 'fool' the police radar into thinking that even a house coming down the pike at 120mph was doing 55! (with all the different types of police radar in use now, I doubt it'd be effective anymore) ....but, you're right, it didn't take very much of a signal to drown out the reflected signal.

There is no real problem in paralelling power supplies. It is done all the time. The problem here is that the power supplies he wants to use. They drift to much to keep the loads equalized. You can conpensate for this to some degree by using current equalizing resistors in series with each power supply. Resistors large enough to compensate for the poor regulation of the Pyramid powersupplies would probably seriously effect the efficency of the whole setup. Maybe you would get less than 30 amps out.

Full All-metal CB omni antennas have been illegal to market as "CB" base antennas since the 80's due to the hazards. That's why all the "Stardusters, Ringo rangers, radio shack groudplanes etc..", either dissapeared years ago or are imported & labled as "10M ham" antennas or "Commercial" antennas (like the Maco 5/8). This reg doesn't apply to beams, TV or ham antennas, only those sold as "CB" in the USA.

the HAM is allowed to have one in thier posession but they are
not allowed to use it on the 11 mtr band. 10 mtrs it is Ok up to
a limit. and is OK on all the other bands..... if the HAM gets
caught using it on the 11 mtr band they will lose thier license
and possible fines. for the CBers if they have one it is
assumed that they are using it on 11 mtrs and it is illeagle

(illeagle = sick bird)

2156. Antenna/Amp Questions

Newsgroup: rec.radio.cb
Date: 2000-07-13 00:00:00 UTC
From: C-4 <hbrown1@triad.rr.com>
Message-ID: <njnb5.88$y8.1162@typhoon.southeast.rr.com>
Source record: 44141

Hello, I have the following CB radios:
Cobra 19 Plus mobile, 40 Channel (manufacturing date is in 1989), still works great, just been beat up a bit, but no internal problems at all.
GE (general electric) Hand Held CB 40 channel (brand new, everything works).

Both 4watt output. I also have a 28" (inch) magnetic mount antenna for my Cobra CB (I wanted to start small, but I will get a larger antenna soon). I did a transmission and reception test between the 2 (I had to get about 20 or 30 feet away to stop the feed back) and heard my self (I tested transmission on both radios). Both work good. I realize that I should get a amplified speaker for the CBs right? For better sound quality? Now, do I need some kind of ground plane kit for my magnetic mount antenna? I am not exactly sure what that is or how it is used but I hear people saying that they need one.

On my hand held, there is a connection for an external antenna. The jack looks like an RCA-type jack (as in the type of cables used in audio and visual equipment). Do they make antennas that use this connection? Or do I just get an adapter to convert that jack to another type of connection (I know exactly where to get all this stuff too)? Now I am guessing linear amps connect directly to the antenna? And the CB connects to the amp? Is that how it works? I have never seen an amp in action (but trust me, I have heard it in action, some foul mouth moron from Arizona). Also, do the amps just get their power from the same power source as the CB? As in the car battery? Thanks for answering my many questions, I am new to this CB radio stuff (I really like radio communications).

I guess this is my new handle to use:

I was wondering just how loud that Robyn was if it is still new and in the box.
I always took my stuff out of the box and hooked it up to see just how "loud"
it was..

Maybe I`m missing something here. Is it the color of the rig that makes it
"loud" ??
Is it Lime Green or Hot Pink or Neon or something like that. You could tell by
the color on the outside of the box and wouldn`t have to open it.

Sorry, I couldn`t help myself.

Radio Shack has an adapter for using handheld with mag mount.

> Now I am guessing linear amps
> connect directly to the antenna? And the CB connects to the amp? Is that how
> it works?

Amp goes between radio and antenna. You need to have the radio and amp tuned for one another at a cb shop before operating the amp.Also make sure your antenna is capable of handling the amount of amp output you'll be sending it.

> I have never seen an amp in action (but trust me, I have heard it

Yes, you need to run the wires for the amp straight to the battery though. No cigarette lighter, or fuse box like you can with the radio.

An SWR of 1.5 : 1 or less on a feedline is considered flat. Read the books prof (I am assuming you know how to read). Just in case you can't, get someone to read this to you. From the Amateur Radio Handbook, "If the s.w.r. is below 1.5 to 1 the line is essentially flat".

No it does not necessarily indicate that the relay is okay. The relay contacts
that
switch V+ to the TX circuits may not be contacting and thus causing no
TX on AM and SSB. Even though the TX red light comes on, that is fed by another
set of contacts I believe. Don't have schematics in front of me, but I am
pretty sure
of this.

> Voltages check out okay up until the finals, so I have ordered replacements

> Linus
>

If you are measuring proper voltage levels at the finals at least that indicates
that
the RF final transistor is not shorted. When trannys fail they ususall short.
However
yours may have opened instead of shorted. If the Final transistor is bad, make
sure your
driver transistor is okay too.

Good Luck!

Unit 824, out!

2166. Re: Crude Base Antenna - How To Lower SWR?

I have a RCI 2950 driving a 4 pill amp. When the amp is turned on and I modulate it starts to squeal. Once it starts squealing i can turn the mic gain off and it will still squeal. The swr is under 1.5 and everything seems to be in working order. Without the amp on the radio won't squeal at all. If anyone has any suggestions that can help me get rid of that squeal that would be great. Thanks.

Brian

.....

Has anyone added talkback to the radio or any type of speech processor?
check your jumpers for poor shielding(ground) and then make sure that all is grounded to a common heavy cable going to chassis.
You are losing ground somewhere.
Has anyone cut the limiters in that radio? Any over-modulation on top of poor ground will be cause to squeal.....

It's been well established that advertising can be false or misleading. By your own definition, channel 23 was used for other purposes, not the generic CB that everyone here perceives it as. BTW, what was the OTHER CB service you referred to? 25 watts hardly warrants a linear amp, and it's hard to imagine limiting anything to only 25 watts. Why not quote the legal stuff rather than an old ad. In the mean time, for all practical purposes, CB has not been allowed external amps. Why do you seem to go of your way to split hairs??

Most shops sell 'em... and if the shop is worth a damn they can set
your radio up for one... as for the legal part.... no your can't get
one for a cb legally but you CAN get them and many people do. won't
endorse doing something illeagle but I run one so can't say too much
bad about those who do use amps.

According to the 11 PM WABC-TV News tonight, the Town Council
of Marlboro has, indeed, passed the ordinance banning
cell phone use while driving in the township of Marlboro, NJ.

I don't know if that was "on first or second reading"
of the ordinance or not. Depending on the type
of government in Marlboro, the mayor may have
10 days to veto the ordinance.

I'll see what the local papers say about this tomorrow.

Don't kill the messenger, I'm just reporting the news.

Cheers,

Source record: 44166

Alrighty it's been years since I had a Grey 300 but it has always been one of my favorite amps but I was just wondering a few things... at normal voltage say 12-14v (as in a car without a modified altenator etc) exactly what kind of power do they actually put out? I've seen so many different stats on them that I don't know what to believe and I could have sworn the one I had many years ago had a dead key of 300 watts with 4 watt drive and would swing up to around 400+ watts. Am I right in this or have they changed since '91-'92? Or was the meter the tech using total bullshit (which was a bird meter in case you wondered)

also does the Grey line of amps have a website?

thanks.

'Doc <w5lz@oio.net> wrote:

: Bill,
: !! Now I know why you think as you do!! Unfortunately, your
: mistaken. An SWR meter does use a section of coax in picking
: up the voltages in the feed line, but! That small length of
: coax is no longer of what ever impedance it was supposed to be
: to start with. It's too short to exhibit a characteristic
: impedance, and is only used because it's a convenient way of
: mechanically making the 'pick-up'. There are any number of

Wrong. Even a transmission line that is 1/16" long will have a
characteristic impedance.

: SWR meters that do NOT use a section of coax in their circuit.

Sure, so what? Even two somewhat parallel wires will have a
characteristic impedance. So will a box (acting as one conductor)
with an insulated wire taped to it.

: A voltage 'pick-up' is usually a wire run parallel to a piece
: of center conductor and dialectric insulation from a section
: of coax. There's a second wire run parallel to the same section
: of center conductor/dialectric for reverse voltage pick up. It's
: usually done this way because it's easy to do, run the parallel
: wires and then tape them to the dialectric insulation. You can
: do
: the exact same thing by using 'stiff' wire that will hold it's
: shape, and not use part of a section of coax. You'd have to
: recalibrate the circuit because voltage varies with distance.
: The distance between the pick-up wires and the wire carrying the
: signal would change, probably.

See above.

: But an SWR meter does NOT have a piece of coax inside it to use
: for comparison to the output. It compares the input of the meter
: to the output of the meter.

Where have I said otherwise? And what does this have to do with the
characteristic impedance of the line through the meter? How the
signal is tapped is immaterial, except in how it affects the impedance
of the transmission line.

From: Bill Nelson <billn@spock.peak.org>
Message-ID: <8km3m7$9n7$6@bashir.peak.org>
Source record: 44170

'Doc <w5lz@oio.net> wrote:
: Bill,
: First, there is not internal 50 ohm coax section that the
: SWR meter uses for comparison. Take the back off of a Radio
: Shack SWR meter, or an Auteh Research meter, or any other
: 'Wheatstone Bridge' type SWR meter. Do you see any piece of
: coax in there? No, you don't! So if SWR meters work as you
: suggest, what do these meters use for comparison? Remember,
: there is no coax inside of them!

You don't need coax to have a characteristic impedance. I have used
two parallel traces on a printed circuit board as a transmission line.
The thickness - width - spacing of the traces was trimmed to get the
desired impedance.

: As I said before, an SWR meter uses what is on the input
: of the meter and compares it to what's on the output of the
: meter. Take your own suggestion and do some reading.

It does not. It looks at the voltage on the transmission line
section inside the meter - in both directions.

: Or, here's another way of looking at it that bares directly
: on what the meter does, read forward and reflected voltages.
: The meter 'sees' the forward voltage coming from the transmitter,
: it 'sees' the reflected voltage coming from the antenna. It
: compares these two voltages, and the relationship of these
: voltages is the same as the relationship of the transmitter
: impedance and the antenna impedance. This relationship is
: expressed as a ratio, and is called Standing Wave Ratio.

Nope. The relationship is between the load impedance and the
antenna impedance.

: I give up. You have not changed my mind, and won't when
: I know I'm right. But, I'm tired of beating my head against
: an idiot. The only thing I regret is that you're to 'set' in
: in your ways to listen. It's a shame that some people will
: believe you.

Too bad that you "know you are right" because you are not. Try
opening a book on basic transmission line theory. You might learn
enough to be able to intelligently discuss the subject.

Message-ID: <8km42t$9n7$7@bashir.peak.org>
Source record: 44171

'Doc <w5lz@oio.net> wrote:

: Tell me exactly how an SWR meter can measure a mis-match at
: a remote point, unless the feed line is a whole number multiple
: of an electrical 1/2 wave length. If the feed line IS a
: multiple
: of an electrical 1/2 wave length, then yes, it is in effect
: transparent, it presents the input impedance of the load end
: at the feed line's input end. That's the only case where this
: will
: be true.

Wrong again. It does not matter how long the transmission line may be. The meter is, in essence, looking at two currents through the meter. It does not care what the impedances are at either the input or the output. But if the meter does not match the coax impedance, then the indicated SWR will be incorrect, unless the coax and antenna have a perfect match - in which case there is not any reflected power.

: An SWR meter is not frequency dependent. It is also not
: impedance
: dependent. It will work at 1.5 Mhz and at 30 Mhz. It will
: work
: in a 50 ohms 'system', and it will work in a 450 ohm 'system'.

Sure, as I noted above. But it will not provide correct readings if the SWR meter does not match the coax impedance. The reason for this is that the impedance mismatch will cause part of any power reflected back to the meter to be reflected back towards the antenna - so the meter does not see that part of the reflected power.

It is rather simple, really.

: An
: SWR meter works by comparing forward and reflected voltages,
: which
: are a product of the impedances at the input and output of the
: meter.

You keep saying this, but it will not change the fact that you are wrong.

: An SWR meter can not read SWR at any point in an antenna
: system,
: other than the point at which it is inserted, except in the

: instance
: I cited above. If you have an SWR meter that can measure at a
: point remote from it's self, you better hang on to it, 'cuz
: it's
: a miracle! Start watching for that star in the East, and those
: three guys on camels!

Funny. It does not matter if I put the SWR meter at the antenna, or at the transmitter with 50 feet of coax in between. I get the same SWR reading. Something tells me that this "miracle" is not so miraculous after all.

Has anyone tried to replace the audio amp in the radio (5watts or so)
with a higher watt unit (10 to20) to increase the mod to the finals?? I
tried this by added a amp(50 watts) after the radios amp on a am radio.
It gave my about 20 watts on peak swing. I tried this on an am-ssb rig
it blew the finals. My guess is the am rig is running the finals as
class C and can take the extra voltage peak were as the ssb rig runs
class AB - B so the finals couldn't tolerate the extra voltage. Any
thoughts on the idea?? Thanks...

: I have a RCI 2950 driving a 4 pill amp. When the amp is turned on and I
: modulate it starts to squeal. Once it starts squealing i can turn the mic gain
: off and it will still squeal. The swr is under 1.5 and everything seems to be
: in working order. Without the amp on the radio won't squeal at all. If anyone
: has any suggestions that can help me get rid of that squeal that would be
: great. Thanks.

It sounds like you are getting currents on the coax, which is getting back into the radio. Apparently it is not enough for the radio to cause any problem, but the extra power of the amp does.

It is possible to eliminate the problem. The solution depends on your setup - and a person would probably have to see it to give a decent suggestion.

The audio amp circuits in most radios are usually more than capable of 100% modulation. If I were to mod the audio on a radio I would start at the other end. I would upgrade the mike amps (drivers). They are the first one to two transistors in the chain from the mike connector. Small changes here will produce larger changes on the modulation end so don't go crazy with it. I hope you still have your stock mike.

Here is some more information. It just not the RK56 that won't key it up.
A Bum 1 will not key it up either. The only mic that will key it up is a
stock mic. How strange HUH?

He is using a stock mic on it until we can get it figured out. The radio
has been hacked by the best and has an audio squeal after 10 o-clock on the
mic gain. We all know how good the schematics are on these things.

Other than those two problems the radio works fine.

God Bless
Debbie

the PA courts have just repealed one of those silly laws here in pa.. they said since it's not a state wide measure, they can't enforce it in just one small area like that.. if i didn't just get home from working 14 hours, i'd post the entire article.. basically a township passed the law after someone got killed by a person on a cell phone.. so they passed a law saying you couldn't use cell phones while driving, it didn't apply to cb radios.. anyway, a guy got stopped, fought it, and the court said there's no way they could uphold such a law unless it is state-wide.. take care, i'm dragging my ass to bed!

well the hack and the squeel have nothing to do with the
keying...to get the radio to key the switch just shorts out pin
1 to pin 3....and that puts the radio into transmit mode.

take a screwdriver and short out the pins on the radio
momentarly if the thing keys then the trouble is in the mic.
period. the only way one mic will work and the others wont is
that the others arn't wired for cobra/uniden/galaxy.

Corrosion on the batt terminals COULD cause the noise you're hearing. It'd be a good idea to clean those terminals and binders... but there are some other things you should check, as we..

When was the last time you had a tune-up? Spark plugs which have resistors in them (which most cars these days use) sometimes go bad, shorting thru the resistor and causing the "tick-tick-tick" type noise you'll hear.

Check your spark plug cables, distributor, etc, for loose connections, bare wire, etc... If the plug wires are old, and the problem wasn't a bad spark plug, a bad wire could cause the same noise.

If the problem is a whine, your alternator could be going bad (dad? ::grin::). Nothing you can do about this except replace it, or its module. A good quality (read FOUR lead) power input filter might help lose some of this nois.

Next check your coax and antenna... clean any corrosion off the contacts, and check the shield and center lead on the coax for continuity... any more than 2 ohms or so, and you should scrap it and get new coax and ends.

Hope this helps you pin down the problem, and 73's

No, the 'RC' channels were spaced every 50khz and were between
3-4, 7-8 and so on up to one between 22-23 at what is now
channel 25. In the original 23 channel scheme, there were 2 slots
between 22 and 23. One was an RC at the normal stepping (25).
The other was a shortlived business service on what would now be
24. ORIGINALLY I believe this 'business' service ALSO had
a shared service aspect with channel 23, as well as it's own
frequencies out beyond 23.

The original RC channels were only 500mw (That is 1/2 of a watt).
I still have a Controlaire system for that service. It's out in my
garage
with an old RC boat and until I moved from my divorce I still had the
original manuals and even the FCC rule book that came with it. But
the Controlaire system, as good as it was in the 60's, is now terrible.
It is a 'reed' system. It generated single tones and the receiver
applied the audio to a coil under a series of tuned 'reeds'.

I was converting the boat to an old system a friend gave me. When
the aircraft RC moved, he gave me his old system (digital proportional!)
and I was going to convert the boat.

Anyway.... With regard to the 'business' service...

Someone told me that they were allowed 25W, and this MAY be so.
But I don't believe they were EVER allowed to put an amp on a CB
to get to that. If you legally were on this service, you had to have
equipment for that service.

ALTHOUGH for a while, the rules actually DID allow CBs to be used
on the service. In fact, the 23 channel rules said the rig could have a
TOTAL of 23 channels. To LEGALLY use a CB on this service, you
have to have CB channels deleted so you STAYED at a maximum of
23 channels.

The ruling is quoted as saying:

(d) Paragraph (c) of this section does not apply if you hold a
license in another radio service which allows you to operate an external

The only service that issues a license that allows this would be HAM.
Technically MARS or military as well, but MARS is an extension of
HAM, and military doesn't issue licenses.

Then again, you COULD argue that if you had a license for VHF low
band, you would technically be covered, even though you had no
possibility of using that CB linear on VHF low legally. Letter of the
law, right?

It's a 'main' story on the CNN/US page.

To quote....

The Township Council voted 4-0 Thursday night in favor of the ban. Mayor Matthew Scannapieco signed the ordinance a short time later.

Under the ban, anyone caught driving with a hand-held cell phone is subject to a fine of up to $250. Hands-free cell phones are permitted, however.

"It is in the public interest to prevent injuries and save lives, and if I can save just one life with this ordinance, then I'll have done my job as an elected official," council Vice President Barry Denkensohn said.

First off, notice the "If it saves just one life" bulls___! Ban cars idiot!!

It is unclear if the law applies to other 'hand held' devices, or just cell
phones.

Hand-held cell phones are legally distinguishable as they are interactive
in both directions.

However, if the law also applies to HAM and CB, then I think it would be very appropriate for citizens to file summary complaints against any police, fire, and ambulance operation of radios by the driver while the vehicle is in motion. I mean, an officer is doing a lot more than just driving, so his operation of a radio would be even more dangerous!

>> lower his SWR?
>>
>> - Anonymous
>
You dont need to go to all of the trouble. Run the radial wires directly from the mirrior mount. All of the flat surface area is connected to the braid or shield of the coax, you will need to drill 3 holes or hook them up around the nut that holds the whole shebang together. Do isolate the mount from the pole. This can be done by putting a piece of PVC over the top of the pipe and mount the mount to it would be the best way. Use 3 wires the same length as the antenna and vary the angle of the wires to achieve your best SWR. I have built several ground planes for various bands and have used wire or aluminum tubing. Please feel free to Email me for any addtional help you might need or even a detailed diagram.

Gary,
The 'other' CB service was a VHF one. Still had to use
type accepted equipment, and no need for an amplifier with
that. I have no idea what ever happened to the Class -B(?)
service.

Paddler,
Sounds like another one of those 'urban ledgends' kinda thing.
Antron hasn't been in busness in years, and even if they were,
'recalling' the antenna would be a very silly thing to do. It
would be much simpler, not to mention cheaper, to mail the
owner's
the warning tag. I think 'this' one needs a lot of salt!

Buckaroo,

Last chance now. I know you are a smart assed child but you say you can read. Even if you go to a school in Georgia, at least a few of the kids can read and comprehend. If not, print this out and have an adult explain to you what it means. This might be a stretch because you might not know any adults in Georgia who can actually read and write. Now, what part of this do you not understand, and please point out the section that says it is alright to use an amp? Please don't talk to us about what the book said which came with your radio. The following is the law, and I have given you the url it came from.

From: http://www.access.gpo.gov/nara/cfr/waisidx_98/47cfr95_98.html

TITLE 47--TELECOMMUNICATION

COMMISSION (CONTINUED)

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart D--Citizens Band (CB) Radio Service

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external RF power amplifier.

[48 FR 24894, June 3, 1983, as amended at 63 FR 36610, July 7, 1998]

Effective Date Note: At 63 FR 36610, July 7, 1998, Sec. 95.411, paragraph (a) introductory text was amended by removing the term ``type-accepted'' and adding in its place ``certificated'', effective Oct. 5, 1998.

Huh? He was referring to the resistance of the contacts. They are not 50 ohms, it is just a relay that has very low resistance (milliohms as the prof says) across the contacts when the contacts are closed. How does a good relay tell you the resistance?

The Game wrote:

Yes it is. They are designed to be used with a certain characteristic impedance.

> It will work at 1.5 Mhz and at 30 Mhz. It will
> work
> in a 50 ohms 'system', and it will work in a 450 ohm 'system'.

Nope, they are impedance dependent, just because you don't see a piece of coax inside the meter dose not mean it can work with any range of impedance's. Most meters are designed to be used in a 50 ohm system, and those will not work in a 450 ohm system.

>
>
> An SWR meter can not read SWR at any point in an antenna
> system,
> other than the point at which it is inserted,

Not that is a real revelation! I would only expect it to read SWR at the point in the antenna system where it is inserted. Just how could it do other wise? So what? It doesn't matter at what point in the antenna system you measure the SWR as whatever the SWR is, it is the same throughout the system. You can't have an SWR of 1.5:1 at one point in the system and 2.5:1 at some other point.

2245. FM CB in the U.S.?

Am signals can coexist with eachother on the same frequency and be heard,
albeit a noisey mess. FM 'grabs' the frequency so that you are hearing the
loudest signal. It would be a cleaner signal, but you would hear only the
strongestg at any given time.

> Is
> there a legal restriction?

yes

> Are any FM mode sets available for sale in
> the U.S.?

I'm not aware of any made or sold here. Selling with in theUSA would not be
legal. Most of this sort of stuf is manufactured in Asia anyway.

2248. The correct answer to c.b. amplifier operation

Newsgroup: rec.radio.cb
Date: 2000-07-14 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <20000714122951.12153.00000402@ng-df1.aol.com>
Source record: 44228

There was a mesage posted on the legality of operation of a linear amplifier on the c.b. frequency.
Most of you responded that the fcc rulings are that no way, no how, anyone could operate a linear amp legally on the c.b. frequency.
I am here to tell you that you are wrong. If you hold a ham license or any other amateur radio license, you CAN LEGALLY operate on the c.b. frequency. However, that doesn't mean you can go buy a bubba-made amplifier that has very poor filtering and splatters all over the airwaves. You must still go by the other parts of the fcc regulation's which is proper filtering. If your amplifier is causing interference on your neighbor's t.v, stereo, telephone or whatever, you are operating outside of the fcc regulations reguardless of holding an amateur license.
If you have a base station and are using power, it's a good idea to call your neighbor and ask if your base station is interfering with them. If you are, simply buy a good quality filter that is made to handle the wattage you are putting out. If you are pretty sure that you are not interfering with your neighbors, ask anyway, it's common courtesy!
I have cut and pasted the legality of c.b. linear operation from the fcc website.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (b) of this section does not apply if you hold a license in another radio service which allows you to operate an external RF power amplifier.

There are plenty of radios on the market that have FM capability. Best advice would be to learn the laws and penalties concerning use and violations in the US and only then can you make a rational, informed decision on what path you choose to embark.

2257. Re: FM CB in the U.S.?

No FM mode in the states for the cb band. 'Course some folks use it. If you have access to the freeband, scan the freqs SLOWLY in FM mode when the DX is running. Chances are you may find someone, especially on the weekends. When the international skip is running to Europe, you may even catch a wave.

> suggest, what do these meters use for comparison? Remember,
> there is no coax inside of them!

It can be the spacing and length of traces on
a board (like inside many CB radios), it can be
the spacing between three solid conductors
(like inside many meters and remote pick-up units),
it can be the relationship between 3 wires with a
ferrite bead slipped over them (like inside other
CB radios). The point is that regardless of
the method, each simulates a section of 50 ohm
transmission line. Like I said before, it's in
there. You're just so blinded by your own belief
that you can't (or won't) see it.

> As I said before, an SWR meter uses what is on the input
> of the meter and compares it to what's on the output of the
> meter.

SWR meters compare forward (incident) voltages
and reflected voltages using a directional
coupler that has its own characteristic impedance.
The coupler impedance is the same as that of
a piece of the feedline used in the antenna
system. SWR meters are self-contained; they
don't rely on the impedance of anything connected
to them.

> Take your own suggestion and do some reading.

I have, and my belief (that originally agreed
with yours) was proven wrong time and again.

> Or, here's another way of looking at it that bares directly
> on what the meter does, read forward and reflected voltages.
> The meter 'sees' the forward voltage coming from the transmitter,
> it 'sees' the reflected voltage coming from the antenna. It
> compares these two voltages, and the relationship of these

> voltages is the same as the relationship of the transmitter
> impedance and the antenna impedance. This relationship is
> expressed as a ratio, and is called Standing Wave Ratio.

You're wrong when you think the transmitter
impedance has a bearing on the relationship.
SWR meters compare the forward and reflected
voltages, currents, and phases within its own
characteristic (built-in, constant) impedance.

When you think about it that way, even the
load impedance doesn't really matter. If
there's a mismatch between the feedline and
antenna, power is reflected. The SWR meter's
internal 50 ohm characteristic impedance bridge
that is normally balanced becomes unbalanced
when reflected power is detected. The level of
imbalance is what dictates the meter reading.
That's what it all boils down to. If you want
to read impedances into that, be my guest.
The problem is (and it always has been) that you
won't be able to support your argument with any
practical experiments. When you change the
source impedance the incident (forward) power
level will change, but the SWR meter reading
(once the meter is recalibrated to compensate
for the new level of incident power) will stay
the same.

You've performed the experiment--you know this
is correct. The best you could come up with
is that a pi network isn't an impedance trans-
former. That's just plain-ass wrong. And you
know what's worse? On top of it being wrong,
it's weak. You should have given up and accepted
that you were wrong right there. I did. But
instead you go on and on with more weak, lame,
crap.

> I give up. You have not changed my mind, and won't when
> I know I'm right.

That's the problem; you insist you are right
when you're really just stubborn and closed-
minded.

> But, I'm tired of beating my head against
> an idiot.

You must have two heads.

> The only thing I regret is that you're to 'set' in
> in your ways to listen.

It's my belief that changed. It's you who
are too closed-minded to accept that you are
wrong even in the face of a ton of proof.

> It's a shame that some people will
> believe you.

I've proven my points with examples and
experiments that I've laid out for you.
And, I've answered your questions. On
the other hand, there have been entire
posts of mine that you either chopped up
or never responded to at all. You've
also failed to provide a relevant exper-
iment that proves your belief, and to
answer point-blank, relevant questions.
I've done my job. There are others that
I agree with and that have agreed with me
throughout this thread. No one here has
agreed with you. And after all of that
you think people shouldn't believe me?

Your problem runs deeper than just a mis-
understanding of how SWR meters work.

If I would get at 600 watt amp (The dirtiest I can find) and place a rubberband around the mike so I can broadcast all the time. How safe would I be from getting clocked. Also what would be the best freq to transmit on 11 meters for that purpose?

Is that the SWR between the radio and amp or
between the amp and antenna?

> Without the amp on the radio won't squeal at all. If anyone
> has any suggestions that can help me get rid of that squeal that would be
> great.

2950s are touchy about working with unstable
amps--especially the vertical tranformer units
like Boomer, Palomar Elite, Boomer Deluxe, etc.

The level of amplifier instability will show
up in a test of the output (between the amp
and antenna) SWR. Put your SWR meter in the
line as close as possible to the output of
the amp. Check and optimize the SWR with the
amp off. Note the reading. Turn the amp on
and re-check the SWR. The difference in
readings equals the level of amplifier in-
stability. If the SWR with the amp on is
fairly high, the amp is pretty unstable and
is causing enough coax shield and ground
radiation to cause an RF feedback problem.
If that's the case, the best solution is to
have the amp worked over by a tech that knows
amps and knows how to increase the stability
in inherently unstable amps. Other, more
Band-Aid-like, possibilities include: changing
the physical relationships between the radio,
amp and antenna (move the amp around and see
if there's a spot where the squealing stops),
changing the coax length between the radio
and amp, using a matchbox between the radio
and amp, and changing the coax length between
the amp and antenna.

If the SWR between the radio (or amp) and the
antenna is low, the RF ground is adequate and
additional case grounds won't improve anything.

If the SWR is high and/or you are experiencing
symptoms (like squealing or things in the vehicle
acting strange) that improve when you add a
case ground, the RF ground is inadequate. An
inadequate RF ground is an antenna problem that
should be solved at the antenna if possible.

Yeah, maybe maybe this attorney has a problem with interpreting laws and regulations.
You said "they are referring to "other" bands if you have a license."
Never do they once mention what "other" bands are. "Other" is never mentioned.
"Another radio service which allows you to operate an external RF power amplifier" is mentioned.
Yes or No. Is a ham radio another radio service? YES!!! Is ham radio service a radio service that allows you to legally operate an external RF power amplifier??? YES!!!
I will cut and paste again just for you part D.
(d) Paragraph (b) of this section does not apply if you hold a license in another radio service which allows you to operate an external RF power amplifier.

Open ass, insert foot.

2266. Re: The correct answer to c.b. amplifier operation

Newsgroup: rec.radio.cb

Source record: 44246

....and your point is....???

Paragraph 'C' says that you are presumed to be guilty of using an amp if you have an amp and a CB radio and there is evidence that you have used them together. Paragraph 'D' says that this assumption of guilt doesn't apply if you are licensed in another service that is permitted to use an amp. That certainly doesn't say that you can use the amp on 11 meters. What part of the following do you NOT get?

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called

linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a

signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.

(c) The FCC will presume you have used a linear or other external RF power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external

RF power amplifier.

ICEMAN,
It may seem that your correct if you don't read the rules very
carefully. It's not easy to catch the meaning of par-c,
sub-par-d,
if you read it quickly.
What par-d says is that if you hopld a valid license in
another
radio service that allows the use of an amplifier, then par-c is
no
longer applicable. That means that if you possess an amplifier
and
have an amateur license, they do not assume that you are using
the
amplifier on the CB band (see sub-1 of par-c). , since you have
a valid right to own an amplifier that can be used on the CB
band.
If you have an amateur license or not, par-c sub-2, is still
applicable.
If they have reason to believe you are using an amplifier on the
CB band, amateur license or not, they "gotch'a".
No one is allowed to use an external power amplifying device
on
the CB band. The R&R's say you can't. I admit it isn't the
easiest
thing to understand, but that's what they say. (and they were
supposed
to re-write the rules to make them easier to understand?)

Just wondering if there is a "code" of operation, or an unwritten gentleman's agreement on how to operate on 38 LSB ? e.g. how often to call "CQ DX" or respond to a "CQ DX" from other people, or how long a conversation should be so as not to hog the channel ?

I seem to have annoyed somebody down in Alabama lunchtime today, but I have no idea why. Either that or he was complaining about somebody with similar call numbers (or he was a nut). I am just a mobile up in Canada having fun with the radio on my lunch hour.

Constructive criticism appreciated from anybody who heard me today.

Cheers,

Richard.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size 40 channel unit with carrying case. High/low TX power switch. Around 5 watts output on high. LCD display with TX and receive meters. Great shape. Original long (around 5 feet) center loaded antenna. Has external antenna, power and charging connections. Has an 5-pin external mic connection as well. Uses 8 'AA's or 10 'AA's rechargeables and you can recharge the batteries WITHOUT taking the batteries out. (Batteries and charger not included)

Asking only $ 35.00 plus shipping.
Great deal ! ! !!
A Picture can be e-mailed.

The specs may tell you the voltage and or the resistance of the coil, which has nothing to do with the contact resistance which should be either infinity when the contacts are open or for all practical purposes zero ohms when closed. So what is all this about the relay should be 50 ohms unless you are talking about a coaxial relay that is built much like a piece of coaxial cable and is designed to have a certain characteristic impedance. But again, that ohms of impedance does not refer to the resistance of the contacts.

> etc) exactly what kind of power do they actually put out?

As I remember, the 300 is a 4 device amp that uses
the smaller, 3/8" flange transistors. If that's
the case, it should be good for 400 peak watts in
daily use (12-14 volts and normal drive levels).
As for the dead-key power, there are a number of
different views on what percentage of the peak
power the dead-key should be set at. I like to
go with a ratio or 4:1 (dead-key set at 25% of
the peak output). For example, an amp that does
400 peak would dead-key at 100.

> I've seen so
> many different stats on them that I don't know what to believe and I
> could have sworn the one I had many years ago had a dead key of 300
> watts with 4 watt drive and would swing up to around 400+ watts. Am I
> right in this or have they changed since '91-'92? Or was the meter the
> tech using total bullshit (which was a bird meter in case you wondered)

That seems a bit high. If the meter was a peak-
reader, the 400 or so peak is believable--especially
if the tech was using a hot (14.5 or higher volt)
power supply. On the other hand, if the meter was
not a peak-reader, that amp would never hold a 300
watt dead-key. In other words, the amp could be
set to dead-key at 300, but the wattage reading
would decrease (backswing) with modulation and the
audio would sound pinched and/or muffled. Regular
Bird meters work on a peak to carrier ratio of about
3:1 (when the modulation is symmetrical). In other
words, if the amp produces 400 peak watts it will
probably hold (no increase or decrease with modulation)
a wattage of about 133 (400 divided by 3) on a
regular (average-reading) Bird.

The relationships in an AM signal can be confusing.
Average, RMS, peak, PEP--what do they all mean?
If that's where you're at, try the AM tutorial on
my website. There's a link to it below.

> also does the Grey line of amps have a website?

I don't think so. There are guys selling them on
the 'net, but I don't think the manufacturer has a
website.

2277. Re: The correct answer to c.b. amplifier operation

Newsgroup: rec.radio.cb
Date: 2000-07-14 00:00:00 UTC
From: JR <jr@some.net>
Message-ID: <396F5288.C7BFD8D5@some.net>
Source record: 44257

Sorry, but even with a ham license, when operationg on the 11 meter band you are bound by the same rules as everyone else operating on that band. Holding a ham or any other license does not make it legal for you to run an amp at over the legal limit set for the cb service. It does not give you the right to operate non-type accepted equipment (such as your ham gear) on the band. When operating on 11 meters you are operating under cb rules and your ham license has nothing to do with it.

(d) is referring to using an amplifier in another service were you are allowed to operate an amplifier in that service, not on the cb band. Notice that this is under (c) The FCC will presume you have used a linear or other external RF power amplifier if--

The are saying that if you hold a license which permits the use of an amplifier(such as a ham license) you are exempt from being presumed to have used it on the cb band. If you do not hold such a license, and you possess an amplifier it is presumed that you have or will use it on the cb band.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to
your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes
called
linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as
a
signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power
amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external
RF
power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station
with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (b) of this section does not apply if you hold a
license in another radio service which allows you to operate an
external
RF power amplifier.

ICEMAN RRC wrote:

"..does not apply if you hold a license in ANOTHER radio service that allows you to operate an external RF amplifier."
ANOTHER service...NOT CB! You are an attorney? I don't attack people usually, just the issue, BUT since you claim you are an attorney, I guess it is pertinent. Ever win a case? Or are you a paper jockey? In any event, counsel, you are wrong. How does the toe-jam taste?

2279. Re: The correct answer to c.b. amplifier operation

It has to do with presuming operation of an amplifier. See my other post. It means that if you do not hold any license and you possess and amp it will be presumed that you have or will use it illegally on the cb band, but if you hold a license that allows the use of such amplifier in another service, such as a ham license, you are exempt from this presumption.

Take the foot out of your ass and insert in mouth..

Hi Richard,

Think I have heard you on 38 LSB. It depends how busy the band is. If it
is busy I usually acknowledge the station and exchange pleasantries and move
back on the side. If it's not that busy I will chat for a while.

> ground plane with wires, etc?

How about increasing the size of the radiator (the
vertical part) to say a 9 foot whip and a spring.
Then, increase the radials until you get a flat
match (low SWR).

Based on your SWR reading, increasing the radial
length alone won't increase performance. But,
since the antenna is on the roof, you have room
to increase the radiator to a full quarterwave
That should actually increase the performance.
The problem is that the radial system as-is may
not provide an adeqate ground plane for the longer
whip. You'll know when you measure the SWR with
the long whip and spring (or other type of 6 inch
extension) in place. If the SWR is low, the
ground plane is adequate. If not, you'll have
to increase the length of the radials until the
SWR becomes acceptable.

Good luck and have fun.

I just bought the BC245XLT scanner. I understand trunking. I have the manual that came with
the scanner. I need to know where I can find some better instructions. I would like to know
how to store IDs in a certain bank then search only that bank. I would like to keep the police ,
fire, ambulance, ect. in separate banks and scan only the bank I want to listen to. I cant for the
life of me figure it out with these instructions that came with the scanner. Do you know where
I might be able to find better instructions for my scanner. This news group has been helpful in
the past and any help now will be greatly appreciated. Thanks , HIII

I owned one and it's a great radio. The only reason I sold it was because I found a 2950 being sold for $100. Make sure you get the clairifier opened and you do the mod for the extra channels. It will be well worth it.

If you are using it mobile, be sure to wire it directly, and don't use a cig lighter plug.

I think you need to check the amatuer radio rules and regulations,I have been a ham for three years and thought the same as you.I went to dayton Hamfest in '98 and talked with some employees of the FCC and they said that You are not legal to run more than 4 watts AM power,12 watts PEP on ssb
on the 11 meter band.Also if you look at your rules you are only allowed 200 watts with a tech pluse on all allowed freqs on hf with this class liscense.WIth a general or better with in your band limits you are allowed 1500 watts pep power on all HF bands thru 70 cm I am not shure what the
limits are on microwave bands.Also there are no 11 meter privileges on using power on the amatuer
bands it is ill legal you need to read al the rules and if you think I am lying send the Fcc a message.

Hmm, you're actually having luck with one of those. I had one back in the day when I first started and it had SWR around 2 or so. I put a larger bolt in the tuning thread thingie at the top and placed random lengths of wire off all the radials which got the SWR down to around 1.2 or so. Anyone that lived in Raleigh NC around 95-96 that I could talk to remembers that thing although I dunno if any of them are on here......

>I am here to tell you that you are wrong. If you hold a ham license or any
>other amateur radio license, you CAN LEGALLY operate on the c.b. frequency.
>

I really dont know what all the technical jargon is about.....Its pretty easy to figure out, YOUR NOT ALLOWED TO RUN IN EXCESS OF 4 WATTS/AM, 12 WATTS PEP/SSB.....PERIOD.....!!!!! Shit, even a newbie could tell you that. PLUS, I really cannot understand why anyone has to run "Amplifiers" at all. Im in one of the WORST situations imagineable for c.b. I live in a condo, with an indoor antenna, a TOTALLY STOCK radio, and a non-amplified "stock" D104 desk mic, (my radio is a Tram D201/201-A,) If I can talk a radius of 35-40 miles, everyone else could.....case closed.....NO EXCEPTIONS.....for NO reason.....Just my opinion, of course.....ha, ha, ha. Frank.

A code of conduct really does not exist, Common Sense and courtesy is the
your best bet... However you'll probably find many stations who have
neither... Try finding a Frequency that doesn't seem busy make a few
calls... typically when the DX is in you'll find it tough on 38, to hold a
conversation you'll probably need to go above channel 40.....

CD, of course hams don't have a corner on the learning market, I know plenty of CBer's that have a high degree of technical skill..... Any radio service you can imagine have innovators and techie people, They also have your Average JOE who just cares about communicating..... neither method is really wrong or right..... I just feel that people miss out and cheat thereselves by not taking any time to learn the fundamentals.... Technical ability is not everyones cup of tea, but on the other hand an Amatuer operator who cannot even do something as basic as tuning antennas is something that happens too often...

KW

Buckaroo, Give it up already!! Your misinterpreting the booklet, no matter what you think it Never Has been Legal for a CBer OR HAM to run an AMP on the CB radio Service, PERIOD!! As an Extra Class Amatuer operator, I have NO RIGHTS to Run any type of External RF AMPLIFIER on The Citizens Band, or for that matter anything above the legal power level! Doing so Could subject me to Loss of Amatuer Privileges, AND Monetary forfeiture....

Obviously you have a hard time believing this, So call or email the FCC, I'm sure they will set it straight for you......

Your misinterpreting what it is saying. It is saying that if you hold a license (such as a ham license) that allows the use of an amplifier, and you own such an amplifier, you are exempt from being presumed to have or will use it on the cb band. If you do not hold a license that allows use of an amplifier and you have one in your possession you will be presumed to have or will use it illegally. The power limit for the cb band is 4 watts for anybody who uses the band no matter what other license you hold.

>Quote:
""I really dont know what all the technical jargon is about.....Its pretty easy
>to figure out, ..."
It is easy to figure out, but SOME people think that getting a
ham license gives them some sort of "extra privledges" (other than the "in a
real emergency anyone can xmit on any freq to save a life---which pertains to
all citezens, ham or not, alike) on CB that the rest of the citezens don't
have. Some of these people think, for example, they can use their
"modified" ham rigs on CB as long as they turn the power down to 4 watts,
which of course is still illegal. Nothing in the Amateur service rules extend
any special privledges to use non-type accepted equipment in other radio
services such as GMRS, commercial bands, CB or FRS.............., its just as
illegal for a ham to modify his rig to get on the marine band whilepleasure
boating or the CB channels, as it is for a CBer to mod his rig to go above or
below channel 40........

If you can talk 35-40 miles with a barefoot radio(not skip of course), you are the first I have seen that can do this. If what you are saying is true, you don't have "the WORST situations imagineable for c.b."

I have a peaked and tuned Galaxy 99 with a Maco 5/8 antenna, and I am having a hard time talking from one side of my county to the other side.
With the use of a Texas Star 667 I can easily make the trip.

I guess we could all argue this topic until the cows came home, but regardless of what anyone thinks, people are still going to operate with an amp, legal or not.
The End.

I've done it before with a barefoot radio. Although it was from base to base and was on a VERY quiet night with no skip coming in. Plus the guy at the other end had a set of beams pointed at me and I was running an A99 about 80ft in the air. unless that guy is on top of a hill with the setup he mentioned I would not believe him. But with a nice setup and a really quiet night it IS possible from time to time but is hardly the norm without power behind it.

just my 2 cents worth.

Every radar that come across my bench has audio,i also believe it is our state law that they must have audio, it helps so the officer can have a tracking history, he visualy sites the car and confirms it with the doppler audio. If you are good you an tell the speed of a car by the sound of ythe audio When in stationary mode if a car is going away from you the audio will sound be different than an approching car because of the doppler shift.

Source record: 44304

There is a whole new world of radar out these days that are dsp controlled. They now can detect cars driving in the same lane in moving mode what this means that now the cop following behind you can track your speed if he is equipped with one of these new radar where as before they could only "pace" your car . And they can track more than one vehicle coming at you . For instance you are driving 40 mph on a 2 lane highway and another car is going 50 mph behind you the car that is "first and foremost" is displayed in the target window and the second car will be indicated in the "fastest" window.

It is rude to call CQ-DX or anything else when breaking into a
existing conversation if all you want to do is talk about the weather
and such.

Did I just miss that part about being able to run an amp in the part you cut and pasted?
Knowing that there are many kinds of frigging idiots, JUST WHICH TYPE ARE YOU????
What it says in a nutshell is.....There ain't not no way you are allowed to attach an external RF amp to your unit. The only way a ham can *legally* run his ham rig on the CB band is to be able to retune it to no more than 4-5 watts output on AM. Older 23 channel radios are grandfathered at 5 watts. Take the time to read the drivel you post and possibly come away with some understanding of what it is you have read before you begin spouting off!

I am not sure if it's state law that you must listen to the audio, but I do use it... it helps me when I have a vehicle moving away from me and I'm clocking him, and another car is coming towards me. If the car coming towards me is driving faster I can tell by the pitch of the signal and I watch for the radar to switch over to that vehicle so I can be ready to lock him in.

Huh? There ain't one for RF sensitivity. Are you referring to the
tendency of the radio to be real quiet to weak signals? I use a
preamp with mine, and hear almost everything in the mobile.

If you want to use FM mode, get any one of the 10 meter radios available. You can use FM mode in a noiser environment with a high microphone gain and you will pick up less noise, compared to AM mode with the same setup. You will also eliminate all or most of the bleed-over onto nearby electronics that can occure on AM mode.

A decent radio to get for not much money would be the Eagle Sidewinder 400 10 meter radio, or any of its variants (Titan, Dragon, Commanche)

These are all mode units, and so include the FM mode. Why settle for 40 channels of AM & SSB when you can have 400 or more channels and all modes? With 10 meter radios available for reasonable cost, getting a standard 11 meter radio modded for extra channels makes little since. Kinda like the laws outlawing FM usage on the 11 meter band in the United States, which are never enforced any way.

Don't go above 28.00mhz, or below 26.500mhz and everything gonna be alright.

Not to be argumentative or contradictory, but what
I laid out doesn't amount to building an entirely
new antenna--that'a why I wrote it. It's a simple
modification that should result in noticeably im-
proved performance. On top of that, it will teach
you something about antennas without being too
difficult. I'm disappointed you dismissed it so
quickly.

Message-ID: <396E9967.25514E83@asphalt.com>
Source record: 44336

Greetings,

I just tuned a Firestik II on my vehicle. What I observed, was that once the top load screw was set, when I slipped on the little soft plastic cap, the SWR would change and get noticeably worse. When I removed the cap, it would go back to it's tuned setting. Anyone had a similar experience? If so, what did you do, if anything, to cover up the unsightly threaded metal piece on top?

2360. Re: They passed the law - URGENT - You can't talk while you drive in Marlboro, NJ

Newsgroup: rec.radio.cb
Date: 2000-07-15 00:00:00 UTC
From: billsohl@interactive.net
Message-ID: <396fbeb2.1342087@news.interactive.net>
Source record: 44340
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.cb

I obtained a copy of the Marboro
Township law today by FAX, but it is
missing one page. From what I do have, I
can offer the following:

The title of the law is:

Ordinance 2000-18
Marlboro Code Defining and Regulating the Use of
Mobile Telephones while operating a motor vehicle.

Of the pages I did receive, the following is of significance:

The definition of Mobile Telephone is: "including but not
limited to cellular, analog, wireless and digital telephones.

The definition of USE is: "to use a mobile telephone in
(a) dialing, (b) answering, (c) talking, (d) listening.

The RESTRICTION specifically is as follows:
"No person shall operate a motor vehicle on any street
or highway while engaged in any conduct defined as the USE
of a mobile telephone unless the operator is using a mobile
telephone with hands-free technology for dialing, answering, talking
and listening."

The penalty (fine) is: a fine not to exceed $250.

From the above, I don't see this aw directly impacting
use of ham radios and/or CB radios as neither can
be construed as being a mobile telephone. Indeed,
the constant direct use of the word "telephone"
appears (IMHO) to clearly limit the scope of the
law to ONLY telephone type equipment as opposed to
traditional two-way radios such as ham, CB, FRS,
private radio, etc.

Once I get the missing page I'll add an update.

Cheers,
Bill K2UNK
ARRL Local Gov't Liaison

Please not Paragraph (d) again, and pay attention to which paragraph it is referencing. Note that your quote below is mistyped and referens the wrong paragraph. Buckaroo, you will never be a brain surgeon.

I've been reading this newsgroup for years, and I can't recall the actual law being quoted and/or misquoted this many times. Some sort of record is being set.

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external RF power amplifier.

[48 FR 24894, June 3, 1983, as amended at 63 FR 36610, July 7, 1998]

Effective Date Note: At 63 FR 36610, July 7, 1998, Sec. 95.411, paragraph (a) introductory text was amended by removing the term ``type-accepted'' and adding in its place ``certificated'', effective Oct. 5, 1998.

I tend to agree with the Prof. on this. Heck all I have is a chacker jack radio with a Budwiser can antenna on the top of my truck. I can almost talk across the street as long as the wind is in the right direction... And yes I am proud of that!! :)

CQ DX across the street!! :)

(hillbilly to some of us across the street is LIKE the big pond ;)) well the pothole in front of my house does have water in it every-now-and-again!

: There!!! There is where it is, read that tell me that i'm right!!! Finally i
: found it.

Someone made a typo. That should read "Paragraph (c)", which has nothing
to do with attaching a linear amp to a CB rig. That is prohibited for ALL
users - no matter what license they may hold.

(c) refers the the "presumption of use" if the FCC finds a linear amp on
your premises that is capable of operating on 11 meters.

It is pretty obvious that you have never installed a tower.

A hammer would risk putting a dent in the tower tubing, which would make it weaker and more likely to collapse - which would not be a good thing.

The legs need to be adjusted two at a time. Anything that presses on all three legs (at least while only one is in place) is bound to fail.

: 4-5 watts output on AM. Older 23 channel radios are grandfathered at 5
: watts. Take the time to read the drivel you post and possibly come away with
: some understanding of what it is you have read before you begin spouting
: off!

Not totally correct, Train.

An amateur cannot operate a ham rig in the CB band - period. It is not
type approved (or whatever term they use these days) for use on 11 meters.

:> (d) Paragraph (b) of this section does not apply if you hold a
:> license in another radio service which allows you to operate an external
:> RF power amplifier.

How about cutting and pasting without a typo. That should read:
(d) Paragraph (c) ...

Final amp transistors usually blow a direct open from the CE junction
because of the voltage imposed on that junction due to high VSWR.

the term "break" has been around for many years....it means that
you need to use the channel or you would like to make a comment
and add to the conversation...with Hams and the military there
are 3 ways to break. a single break "BREAK" non urgent. a double
break "BREAK, BREAK" means an urgent break is needed...a triple
break, "BREAK BREAK BREAK" is an emergency break meaning life or
property is in danger and help isa needed....
I hear the term QSK being used for break. QSK does not mean
break.... its an old CW term that meant should I use break-in CW
or change to break-in CW. and has nothing to do with breaking
into a conversation.

It will change the input impedance of the antenna. If the
impedance is 'off' in the right direction, changing the angle
of the radial elements may help. And then again, it may not.

Odd that you should mention potty paper. In some states, the color of the paper has been regulated because manufacturers were adding dyes which did not break down readily and caused problems downstream, so yes, that is regulated, too.

Motorola T289 Squealing Problem:

The majority of Motorola T289 TalkAbout FRS radios seem to be defective. Some units will emit a loud squeal when the push-to-talk button is released which is very disturbing and annoying.

Since I originally posted a message to this newsgroup about this problem, I have received multiple emails from people who have had this same problem. There is a message posted to the alt.radio.family newsgroup with the subject "T289 problem" that describes the defect in more detail.

Motorola customer service is aware of the problem.

STAY AWAY FROM THE T289s!

Regards,

Phil Covington

Hello Darrin: The SWR is a measurement of how well the energy from the transmitter, is being used at the antenna. It does not tell you if the antenna is using the energy efficiently.

But keeping the SWR low is a good start.

By adding ground plane wires can only help. But this is like putting ear rings on a pig, you still have a pig, or in your case a low performance antenna.

Suggest a better antenna, such as a ground plane antenna that has 1/4 wavelength ground plane radials. The longer the antenna up to a 5/8 wavelength, the better. After 5/8 in vertical length the antenna starts to radiate the energy in a undesirable upwards, (cloud warming up) direction.

A neat antenna that use to be manufactured was a "Hot Rod" by the guys who make the Francis Amazer Fiberglass Mobile (96 inch long) Antennas. This antenna was made up of 4 ground radials, and one vertical element. Then use a loop of wire at the base, approx. 8 inches long, that connects to the vertical and ground plate, as a tuning wire. The best SWR of a 1/4 wavelength will be about a 1:1.5 SWR, adjust the tuning wire length for a 1:1.0 SWR. This will allow the ground radials to installed at a flat or level position, not angled. The ground plane radials work best at the level angle, and not at an angle. The tuning wire will allow for a perfect match. While the Ground Plane Radials are used to make the antenna work the best, and NOT being used as a impedance matching device.

Running many different type of antennas on Eznec (a antenna modeling program, that shows where all the energy is going) shows that the more ground surface the better the antenna will work.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

2394. THE LEGAL RIGHTS OF RUNNING AMPS ON THE C.B. BAND.

Newsgroup: rec.radio.cb
Date: 2000-07-15 00:00:00 UTC
From: jj475171@aol.com
Message-ID: <20000715112241.28988.00000116@ng-cu1.aol.com>
Source record: 44374

Ive posted a number of RE; in regards to the original post of whether its legal or not to run amps on the C.B. band. Ive seen a few folks out here that have claimed my post was full of S _ _ T when I claimed I was making regular contacts out of my condo, running a stock D201-A with an indoor antenna. My claim was....I could make anywhere from 25-69 mile contacts REGULARLY.....WELL im here to tell you that I DO. My situation is this; I made a "dipole" antenna (wire antenna) cut specifically for 11 meter's, its tucked away in my attic (over my bathroom) it gets pretty moist up there from the shower steam so I bought myself a good antenna tuner to deal with slight fluctuations of SWR, so this configuration keeps my standing wave ALWAYS FLAT 1:1-1/ 1:1-2. this combo has ALWAYS worked well fo me. Im running a "Like New" set of Trams, with a "stock" D104 desk mic, these Trams I have do VERY WELL in the Peak Power dept (4 watts D.C./ 32-35 watts PEP) on sideband as well as AM, Its really not rocket science at all. The only reason ive decided to write a whole seperate post for this topic is, its totally ridiculous when folks out here say that they CANNOT make contacts of excess of 10-20 miles without running an amplifier....THATS NOT TRUE AT ALL !!!!! I dont want "newbies" coming on to this N.G. thinking right away that "the 1st thing I have to do is buy an amp" This is why the C.B. band is polluted with "bleedover" and people trying to outdo each other with bigger and bigger power levels. What the hell ever happened to the days of c.b. where hardly ANYONE had to run an amp to talk???? I dont know, but I found the c.b. much more pleasurable without all this nonsense of "running BIG power" levels just to talk in town, jeez....back in the 70's we ALL shot "skip" and we NEVER had to run an amp to make the trip. I wish you all well, and best regards to everyone, 73........Frank.

so what's you point frank??? what rock did you crawl out from under?
who cares about your 'contacts' with your stock radio and your dipole
antenna up in the attic. if it was always like that , it would
definitely be kind of boring , don't you think. you have to understand
that big radios have been around for a long time and in use even in the
seventies. and in order to get one back then, you had to do some major
ass kissing to the powers that be. there was no internet as we know it
today with amp dealers spread out all over for the world to see. you
had to know someone to get a big radio. so frank you have to
understand, some people like big radios and being radio outlaws. if we
all talked on qrp radios, it could prove to be difficult at times
squashing a rude mudduck, who tries to butt into your qso, that is the
way it has been , and that is the way it will always be. the only way
it is going to be stopped is for the government to declare war on big
radios , ala, the war on drugs and we all know how successful that has
been. so talk to the hand frank. you are arguing with the wrong crew.
big radios is where it is at. and if you can't get down with that, then
get
your ham ass up to other one and get off my band, 73 to you , pal, this
is cd and i am back in the bushes..............

No matter what you say Frank, there is always going to be naysayers. We had this same argument last year with someone who claimed it just isn't possible. No matter how hard one tries, there is always going to be the people that "know best". In '98 I did all states barefoot. In '99 I did it again and had them all checked off by the end of last summer. This year I need 8 more. All contacts were made on the cb band with 12 out on the side or 4 on AM. Go to alfatango.org and you can hook up with many folks that have over 100 countries, and yea, many of them do it barefoot. The local propagation you experience is pretty good off a dipole. I get a bigger kick out of talking to someone on the other side of my state than I do across country. Those seem to be the toughest contacts for me and in all the years of DXing I have only 12 contacts in my state that are more than 150 miles away. But when it comes, it is great propagation.

Typical government knee-jerking... A few people (who probably drive just as poorly when talking to someone INSIDE the car) trigger more stuipd laws that then adversely impact EVERYONE. Why shouldn't I be able to call for directions when I can't find someone's house? Or to call and say I'm late for an appointment - instead of screaming down the highway at 20-over the speed limit (not that I do that, because I don't)?

Now, you would never see them pass a law that triples the standard fine for someone "driving under the influence of a cellphone" when they start driving recklessly, would you? Nope, that makes too much sense.

Where's the law against eating or reading or smoking or putting on makeup while driving? Did a Newt Gingrich wanna-be have a near-miss with someone using a cellphone? (those of you who miss this point - he initiated the cell-blocked scanner law)

No there isn't any actual problem with my swr or recieve.I just figured that the radios are built whith a DC ground antenna system as there intended use.In all actuality I have achieved the best swr I ever have with this particular installaton,dead flat at 27.405.

I do have a slight ignition noise problem, but it isn't anything that the (excellent) NB ANL circuit in my 257 magnum can't completely cover up.And there isn't anyhing squeling or acting funny in the vehicle,I just figured that it couldn't hurt installing the ground,it only took 5 minutes. BTW it had absolutely no effect on the Ign. noise.
Thanks for the replys Doc and Bill
==========
BT S wrote:
Is there any benifit to running a separate ground to the chassis (case) when running an atenna system that isn't DC grounded?
Sully

Bill Eitner wrote;

If the SWR between the radio (or amp) and the antenna is low, the RF ground is adequate and additional case grounds won't improve anything. If the SWR is high and/or you are experiencing symptoms (like squealing or things in the vehicle acting strange) that improve when you add a case ground, the RF ground is inadequate. An inadequate RF ground is an antenna problem that should be solved at the antenna if possible.

Because I didn't talk trash about my IQ. You talked trash about being a lawyer. Now prove it, Liarman! I say you can't 'cause you are a juvie! Put your money where your mouth is, oh, that's right, you can't, your foot is stuck halfway down your throat. Just another anonymous posty who can't back up their lies. That does wonders for your credibility. Even if you may happen to have a clue what you're talking about, lying is the best way to compromise what integrity you have left, which isn't much.

I just want to ask the idiots with cell phones two things.
1:) Is the pay phone at the gas station too expensive?
2:) Would they drive any better if I shove that cell phone up their ass?

Here in the UK we are stuck with 80 channels FM, this use to
limit the range substantially compared to your AM/SSB bands.

The only saving grace was that our antenna restrictions were
lifted about four years ago, and this made a huge difference.

Cheers Mickey

I'm trying to find the extended freq. mods for the Titan RPSY-201
am/fm/ssb ht. I believe it is the same as the Spitfire-242 am/fm/ssb ht.
I've looked around the web a bit but can't find anything on this radio.

Does anyone know where to find this info?

Thanks..Don.

His specs are almost as funny as ICE's Jokes. An 8 element Yagi on a 60ft boom only has about 13.5dbi gain which would be about 22X. Notice that the only thing he guarantees is mechanical construction. I have seen his antennas and they are built well but then so is a 57 Chevy. It wouldn't give his claims of gain either. IF you really want a good antenna invest some of your money in a few books on antennas then go out and build one youself. It is not hard, only slightly more difficult than putting together a stoe bought one. What you recevie in an antenna kit is barely more than than stock bits of aluminum and instuctions on how to put it together. The books will supply the how to and you can buy the parts from most any metal dealer. I used to get my metal from an extrusion mill. They had a rejects bin and would sell stuff from it at just a little over scrap price. Any bits you brought back they would buy at scrap price if you had at least a 100 lbs.
2 to 3 inch aluminum irrigation pipe makes an excellent boom. It is even better if you can find an insulation contractor who can fill it with expanding foam. You can do this yourself with some plastic tubing and a few cans of "great stuff".

2435. Re: Crude Base Antenna - How To Lower SWR?

Newsgroup: rec.radio.cb
Date: 2000-07-15 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000715162354.05019.00001408@ng-cg1.aol.com>
Source record: 44415

>>> Hi! This time I am trying to fix a friend's SWR instead of mine. He has
>a
>>> 10ft. painted pole sunk about 3 feet into the groud. He is using a 102'
>>> antenna and mirror mount that clasps to the pole. He has something like
>10
>>> feet of ground wire wrapped around the mount which is also wrapped around
>a
>>> pole in the ground. The SWR he is getting is around 5. Any ideas how to
>>> lower his SWR?

Simplest thing to do is disconnect the wire from the ground rod but leave it connected to the antenna mount. Now trim it to the same length as the antenna. You will now have a vertical dipole that should work fairly well. SWR should be about 1.5:1. Don't expect it to get much lower than this. If he really wants it to work better he needs to get the antenna higher. Maybe he could strap a 20ft piece of Schedule 80 1inch PVC conduit to the post and mount the antenna on top of this.

2436. Palomar 400HD and SWR problem

Newsgroup: rec.radio.cb
Date: 2000-07-15 00:00:00 UTC
From: oneqck76ta@aol.comSpAmSuX
Message-ID: <20000715163150.18269.00001103@ng-cm1.aol.com>
Source record: 44416

Hello everyone. I have a Palomar 400HD behind a Uniden Grant XL in my 83 Chevy truck. When I put the amp inline with the radio my SWR jump up between 3.0 and 3.3 (about 1.6 just radio to antenna) and when I turn the amp on high the SWR drops down to about a 1.5 to 1.7. I have 6' of coax from the radio to the amp and from the amp to the antenna (5' fiberglass Tunable Wilson) there is 18' of coax. I have tried differant size jumpers from the amp to the radio (tried a 6' and a 9'. SWR ges up with the longer jumper) and from the amp to the antenna (9', 10', and the 18') with little or no luck. I have cleaned up the grounds on the radio and amp and cleaned up the mount for the antenna. I have run other amps and never had this problem before. Any help would be great. Thanks in advance.

Using Urine is only slightly plausible. It does not contain that much salt. A small handfull of rock salt around the ground rod would do more than piss in a couple of months. What you could add using urine would probably leach away before it did any good. Then maybe blutarksy have big family and invite neighbors to come over and piss in yard too.

Last time I put up a tower I had the same problem. I used a couple of bar clamps to pull the legs together a bit. You can also use the bar clamps for spreading too. Just take the pieces of the pipe and put them on backwards with the jaw faces pointing away from each other.

Over 10 inches of rain fell on parts of the suncoast today. Conditions were smokin' even from the mobile. If the lightning and thunder boomers ever stop I can turn on the base and grab some of those signals. Say more rain to come today and tomorrow! Gotta love those summertime storms! Propagation is great after one!

2447. FS: RCI 2970, Texas Star 1200 plust other stuff

Newsgroup: rec.radio.cb
Date: 2000-07-15 00:00:00 UTC
From: "Mr. Breeze" <mrbreezej@netscape.net>
Message-ID: <3970D606.8AE77E40@netscape.net>
Source record: 44427

Hello all, I am selling all of my radio and test equipment. Here is
the list:

I think I am getting out of radio, for good. So I have quite a bit of
equipment to sell. Here is the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB $250
2. One EC 2018 Road Noise Turbo microphone Included with radio
3. One Texas Star 1200 amplifier AM and
SSB $300
4. One Workman 2K Low Pass
filter $15
5. One 24VDC 1.5F
capacitor
$75
6. Two Radio Shack external
speakers $5 ea
7. One Super Penetrator mobile
antenna $20
8. One 6" spring included with antenna
9. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $15
10. One DAIWA Cross-Needle power/SWR meter 2KW max range $100
11. One Radio Shack 3A power
supply $20
12. One Radio Shack Frequency
counter $20
13. One 300 W MFJ 260C dummy
load SOLD
14. One 1.5KW MFJ 264 dummy
load $40
15. One 60A DAIWA power
supply $150
16. Assorted electronic parts in storage drawer
cabinet SOLD

All equipment is like new, REALLY. I take care of my equipment. The
radio and the amp are 6 months old.

If you responded to an earlier for-sale note a few months back, I lost
the messages, computer problems. I am back on line now and want to sell

everything. I will consider reasonable offers. Email a response if
interested. All prices exclude shipping charges. Buyer pays shipping
and money order only sales. I am in the Washington DC area if
interested in

seeing before buying.

John

P.S. I also have a 100MHz O'scope that sometimes works and sometimes doesn't. It looks like a power supply problem that I was too lazy to fix and now it doesn't really matter. It is a Textronix with all manuals. Make me an offer if interested.

Message-ID: <Vn5c5.2744$p41.92552@news1.news.adelphia.net>
Source record: 44431

The reason one D201 is putting out more power than the other is because the HV B+ line to the final tube's plate has probably been jumpered out on the set doing the 15w dead key.

A popular mod for the D201/D201A years ago was to use a SPDT center off switch and wire it to jump out either of the two 5w resistors in the B+ line, or both at the same time. Thiswould yield a l-m-h pwr switch with about 4w, 8w, and 15w dead key. Note that on the later D201A's the 6L6 in the final was replaced with a 6DG6 (or similar- been a long time!). In order to get the higher power in these units, this tube was simply unplugged and a 6L6 put in its place. This was a direct plug-in swap, no mods necessary. A small note worth mentioning is that the 6DG6 (or whatever) was better on SSB, but then again the D201s sucked on SSB anyway.

73 Eric

One can still do these things. It's just that now, one has to pull off the road or park to make the call.....

What may also be interesting is: Does this implicitly ban use of a phone by a passenger? Some states have rather strange definitions of "operating a motor vehicle" (for which the "operator" could be more than just the driver).

> Now, you would never see them pass a law that triples the standard fine for

> scanner law)

Actually, technology has progressed to the point where that law (18 USC 2512(?) ff.) should be repealed. If people want private conversations, use a digital phone or a scrambler (and what the FBI wants is of no concern).

I'm assuming your SWR measurement was made between the
amp and the antenna.

> I have 6' of coax from the radio to the amp
> and from the amp to the antenna (5' fiberglass Tunable Wilson) there is 18' of
> coax. I have tried differant size jumpers from the amp to the radio (tried a 6'

> the radio and amp and cleaned up the mount for the antenna. I have run other
> amps and never had this problem before. Any help would be great. Thanks in
> advance.

The vertical transformer 4 and 5 device amps (Palomar,
Boomer, Boomer Deluxe, Palomar Elite, 400s and 600s)
are some of the most unstable amps currently sold.
Their instability is the reason for a high output
SWR reading.

If the output (between the amp and antenna) SWR is
1.5 to 1.7 on high, you have nothing to worry about.
Be thankful the SWR isn't over 3, you're not squealing,
and the amp unkeys consistently.

Put the SWR meter right at the output of the amp.
Check the SWR with the amp off. Tune the antenna
for lowest SWR. You should be able to get it down
below 1.6 given that you're using an adjustable
antenna.

Then, turn the amp on (high) and re-check the SWR
between the amp and antenna. If it's very high,
(3:1 or higher) you can increase the stability of the
amp by adding negative feedback loops to each power
transistor. They consist of a 33 ohm, 2 watt, flame-
proof resistor and a .1 uF, 25 or higher volt disk cap
in series between the collector and base of each power
transistor.

If the SWR reading you provided is between the radio
and amp, you're seeing the same compromise the amp
designer saw. In other words, the designer had to
optimize the input circuit for one particular output
power setting. The obvious choice was high. If you
want to optimize it for a different power setting,
there is a trim cap inside the amp (near the front
of the amp) that you can adjust for best input SWR
on the desired output setting. Of course, the input
SWR on the other settings will very likely be worse
since you will have changed the overall compromise.

I hope this helps.

You can! Pull off the road and make your call. Just don't make the call while driving down the road at 70 mph with other drivers around. I don't really think that is too much to ask.

Heck, I think most radio operators have enough sense to put down the microphone when they're in heavy traffic. Why does it take a law to make cellphone users display the same intellegence?

"*",
Yes, that's right. But if it allows the transmitter to put
out maximum power, and if the SWR doesn't get too high (3:1 or
so), what's the difference?

What kind of tower is it? Rohn 25g, or a BX or DMX Tower?

If it is A 25g guyed tower, figure out which leg is bent, and use another tower section or a pipe to bend it a little, if it is only off 1/16 or 1/8 inch off, it won't hurt it to be bent to where it needs to be. Be careful to get a pipe that is a SNUG fit.

The antenna tuner only allows you to keep the swr flat between the transmitter and the antenna tuner, it does not change the swr between the antenna tuner and the antenna.

I want to take the time to thank each and everyone of you who have taken the time to check out our website. We are remodeling our shop to where we can make room for our huge inventory.

We are now providing you a new service which I think you will get a lot of use out of, so please take the time to read the rest of this message.

This is not a spam message at all, I am not selling anything at all, I am just providing you
information.

We have a new Swap Shop Mailing List on the CB City website. What this will do will enable
you to post your advertisements to a mailing list, and all the other mailing list members will
get the advertisement as soon as it is posted, thus giving everyone the same advantage in
buying your product. Normally you would post your ad on a message board and it may be a
few days before some people get a chance to even see the message, and this is kind of
hard to make it fair to all unless they are checking the message board every minute.

On the other hand, when others post things that they want to sell or trade, you will be notified
via Email when the ad is posted, that way all Members of the mailing list will get the
message as soon as it is posted and you can stay up to date with what is for sale out there.
Another thing is that you will be posting your ad's to people that have the same interests as
yourself.

I think it will work quite well, so come on over to CB City and Join the mailing list now so that
you can stay on top of what is for sale or trade.

To join the mailing list, Go to the advertisement on the CB City website at

http://www.cbcity.com

Thanks

Charger
CB City

Sent via Deja.com http://www.deja.com/

None, that is the purpose of the antenna tuner, to allow the transmitter to see a good match for efficient transfer of energy and couple that to the antenna system. Now with a high swr on the antenna system you get losses there, but it keeps the transmitter happy.

The answer here is "Yes and no". It depends on the antenna and where
it is mounted. For a ground plane mounted high in the air, you are not
likely to see much (if any) improvement. For an antenna mounted at
ground level, then generally the more the radials the better.

Hm, maybe I can find the trade magazine that had an article on this.

I have *TUNED* President Washington AM/SSB base station CB. I am sure most of you are familiar with this one. I also have a Palomar TX-350 inline, (some might flame me for this but I will continue to use it), I am using a Spectrum99 antenna fed with about 50' of RG8u Coax.
My neighbor has informed me that he can hear me on his cordless phone (without the 350)
and while using the 350 last night he said I was coming over everything, I am not sure what everything was but will find out today some time. I am aware of filters but was wondering if there are additional ways to decrease the RFI from my end aside from removing the Palomar.
I have grounded the chassis to a 100' pine which helped some but not enough.
Constructive comments will be appreciated destructive comments will be ignored.
BTW I live in the San Bernardino Mountains of Southern California. At 6,800 feet above sea level I get to DX just about the whole world. I even hear myself sometimes J/K.
TIA
Red

You grounded the radio to a tree? Have you considered an 8 foot ground rod near the radio, avoiding 1/4 wavelengths so that the ground does not resonate? Are you using good coax? Is the VSWR fairly flat? Where is the antenna in relation to your home and the neighbor's residence, and can it be moved, raised? What sort of telephone is the neighbor using, an old 56 +/- MHz phone or a newer 900 MHz model. Since the radio has been, as you say, *TUNED*, and I'm sure you are proud of that fact, it may now be putting out harmonics and that is what is nailing the telephone. Consider buying your neighbor a 900 MHz phone. Consider having your radio DETUNED.

Your neighbor's electronics are all Part 15 items, which by law must tolerate all signals from other legal services. Your stock Washington should have been putting out a very clean signal, but now that it has been *TUNED*, all bets are off.

If you continue using the Palomar, there may be no hope for you at all actually. I certainly don't recommend their use but if you insist, get the radio and amp to someone who can put it on a scope and look at all the spurs it is putting out and see if there is anything that can be done to clean it up. Otherwise, just keep using it and wait for the neighbor to call the feds. If he calls often enough, you won't have to worry about how badly his electronics are being trashed.

Great answer?????
I hope what he means is that an improper test setup will give erronous
results.
First we have to decide whether or not this 400W figure is PEP or RMS. There
is a big big difference!
Then we need to know what... and how many transistors are in this unit.

Yea professor, but I cannot recall any times in the seventies when cb was at it's peak and it caused a near accident. Seems to happen daily with the cellphone users.

Moved to 535 USB so as not to disturb the Charlie Michaels, but the bleed is still bad enough. How about below the band, like 26.615 usb or something less crowded?

There is some difference. When your talking on your cb or ham radio, you are most likely having a pleasant conversation rather than auguring with or about the spouse, boyfriend, girlfriend, boss, one of your teenage kids, cussing out an in-law, stock broker, or many of the other types of conversations that get people so upset so they loose all common sense of paying attention to their driving. As you state, you understand the responsibility that goes along with operating a two-way radio in a moving vehicle. That is generally understood by cbers and hams, but to cell phone users, it is just another telephone and they are too busy making deals to worry about minor things like traffic safety.

True... but remember the number of cell phone users out there now greatly
surpasses the number of CB's on the road... even in the 70's!

Supposedly... there are around 75 million people nationwide with cellphones!
I'm almost proud to say I don't have one... lol

No it is not a state law that you must listen to the audio, it is a state law to have an traffic enforceable radar in our state it must have audio, which is part of the tracking history you hear the audio and visually see the vehicle. When a vehicle is moving away from you it has a different sound than one that is closing on you, a good radar operator doesnt even have to look he can listen to the audio and tell you that the vehicle is going away or closing on you from experiance.

Sir,

Those are also good reasons to use an antenna tuner. A tuner helps in reducing harmonics as it is another tuned circuit in the system. However if you have a properly designed radio, harmonics should not be a concern. An antenna tuner is no guarantee that you will not cause interference. If the interference is caused by fundamental overload on the devices being interfered with, it is of no help at all...and a good day to you too...JR

tree is good grounding if you use ithas sap in the tree. try urintating
on the tree roots get anmials or small children to urintate on it too.
try hooking your radio grouind up to an old chasys. get a crytsal for
the freqency you want to block out and wire it to a batery abd an 8 foot
whip anttena. blutarsky has many ways to help.

>decrease the RFI

From your end im really not going to reccomend anything (too many thing to reccomend) BUT if he's the ONLY neighbor having this trouble, for approx $5-10 you could buy him some "ferrite beads" to hook up to the affected equipment.......that SHOULD solve MOST of the trouble......good luck, Frank in CT.

Red, You can have the amp on or off something on his end is acting like a reciever, but to get to a cure you may try a few things first off get some better coax, rg 213, 9913 something along these lines whatever fits your budget, next you want to ground your equipment to a copper rod driven into the ground, if you have rocky soil this may pose a small problem. copper pipes don't make good grounds but connect it to the shortest run of low inductance ground strap/braid the closer the ground to the chassis the better. the next may be to raise or move your antenna. If you have a willing neighbor you may want to try testing these low cost solutions, before purchasing any filters. try to eliminate as much as you can on your end before you cover it up with a filter that may or may not work. Every case is slightly different it depends on the actual items that are affected. One filter may work for my case but may not give any benefit to you. Trial and error. Tell him you want to work with him to solve the problem otherwise it can get messy.

Antron is made by SolarCon which is still in buisness right now. they make the A-99 which replaced the antron 99 and now make the I-Max line.

2542. Re: RFI troubles

Newsgroup: rec.radio.cb
Date: 2000-07-16 00:00:00 UTC
From: bkerby@airmail.net
Message-ID: <5BE1E6A2D72FE595.87F568DC5D5BB830.E3C2CFF41BEAC6F6@lp.airnews.net>
Source record: 44522

First off ground everthing the way it should be,also if you use guy
wires if they are rusty that will cause rfi problems.You were a little
vauge on your setup so here goes.When running a ground run it
as short as possible and use a big cable.you are not only doing
this to help solve rfi but protect against lighting as well.If your
antenna is in a tree ground the base of the antenna to the cable
and run it to a ground rod in the ground,for example the cable I use
is the type ,available at hardware stores and even wallmart I dont
know what it is called but it is wire cable it did have plastic on it
but I took the plastic off so moisture wont build up on the cable.
It has been outside for over a year with no rust,and I did get it at
Wallmart the thickist they had.If your antenna is on a pole or tower
ground the base of the pole or tower.Now that is done run another
ground from your amp ,to the shortist possible ground if this involves
putting another ground rod in the ground closer to your radio and box
do so 8 ft copper rod is the best to use,but I have also used other
pipe that wont rust.I also have a 8 ft counter poise at the back of
the radio,It is 8 ft of number 12 wire atached to the back of the
radio and just laid out on the floor.With my install I would have
grounded my radio to an outside ground but it wasnt needed.
I hope this helps rust on the guy wires or ground wires or improperly
grounded equipment is helping to radiate rfi ,also check your
conections
make sure they are not loose and the pl 259 are soldered correctley a
bad solder job caused me rfi greif for awhile .

I keep seeing posts concerning grounding radio chassis'.
If I'm using say a Galaxy 33dx (as a base) hooked to a 10amp power supply through a grounded (mast) A-99, should my radio chassis be grounded? I thought it was through the power supply, or via the coax from the grounded antenna?
If I do need to ground the chassis and do......of what benefit would this be?
I always get good answers,thanks guys,
Ken

what you get out of it depends on what your putting into it....
also if your meter is a rms or a peak reading....and if your ssb
or am.....lot of little ifs, ands, buts,and maybe's....for an
accurate measurment use ohms law of power at the final...

Yes

> from the grounded antenna?

The power supply should ground directly to earth as well.

>
> If I do need to ground the chassis and do......of what benefit would
> this be?

There two kinds of ground-electrical and rf. There are books on this
stuff, so in a couple sentences, understand that this will reduce or
eliminate a great deal of rfi problems.

The same generalizations could be made about CBers, right? Every CBer weighs 300 pounds and answers to Bubba, owns a 12-15 year old Suburban with two 1/4 wave whips bolted through the roof, and yes everything is rusty. Just like CBers, hams come in many flavors with many interests, from the shack-on-a-belt types to moon bounce to television.

Yes a tree. Often people up here do this as the tree is a pretty good ground, it is a temporary fix until I get a ground rod. Coax seems pretty good RG8u. The antenna could be raised. The VSWR is 1.2.
The Radio is beyond being DETUNED.
I attached a 1/4 wave trap and reduced the problem considerably just moments ago.
I will buy a filter soon and maybe a new phone for Tom.
Thanks Gary for taking the time.
Mike

"Gary Danaher" <gdanaher@home.com> wrote in message news:3971DDC2.32DC3938@home.com...
You grounded the radio to a tree? Have you considered an 8 foot ground rod
near the radio, avoiding 1/4 wavelengths so that the ground does not resonate? Are you using good coax? Is the VSWR fairly flat? Where is the antenna in relation to your home and the neighbor's residence, and can it be
moved, raised? What sort of telephone is the neighbor using, an old 56 +/-
MHz phone or a newer 900 MHz model. Since the radio has been, as you say,
TUNED, and I'm sure you are proud of that fact, it may now be putting out
harmonics and that is what is nailing the telephone. Consider buying your
neighbor a 900 MHz phone. Consider having your radio DETUNED.

Your neighbor's electronics are all Part 15 items, which by law must tolerate all signals from other legal services. Your stock Washington should
have been putting out a very clean signal, but now that it has been *TUNED*,
all bets are off.

If you continue using the Palomar, there may be no hope for you at all actually. I certainly don't recommend their use but if you insist, get the
radio and amp to someone who can put it on a scope and look at all the spurs
it is putting out and see if there is anything that can be done to clean it
up. Otherwise, just keep using it and wait for the neighbor to call the feds. If he calls often enough, you won't have to worry about how badly his

electronics are being trashed.

Pedophelia abound! Last hamfest I went to there were many goofy, nerdy types with (insert famous brand of ham HT) radios on their belts. Being 16 and not looking it made for some interesting times including the one guy trying to read both mine and a friend of mine's address off of our raffle ticket cards. I always feel a little uneasy around those people sometimes.

Source record: 44539

I had posted a question about the capabilities of a cb radio to scan. I neglected to mention it would be for a truck.....so.....are there any units on the market which scan and if so can you lock out channels if you want to pass them while scanning. I appreciate any responses as my current cb just died. thanks

Yes a tree. Often people up here do this as the tree is a pretty good
ground, it is a temporary fix until I get a ground rod. Coax seems
pretty good RG8u. The antenna could be raised. The VSWR is 1.2.
The Radio is beyond being DETUNED.
I attached a 1/4 wave trap and reduced the problem considerably just
moments ago.
I will buy a filter soon and maybe a new phone for Tom.
Thanks Gary for taking the time.
Mike

"Gary Danaher" <gdanaher@home.com> wrote in message
news:3971DDC2.32DC3938@home.com...
You grounded the radio to a tree? Have you considered an 8 foot ground
rod
near the radio, avoiding 1/4 wavelengths so that the ground does not
resonate? Are you using good coax? Is the VSWR fairly flat? Where is the
antenna in relation to your home and the neighbor's residence, and can
it be
moved, raised? What sort of telephone is the neighbor using, an old 56
+/-
MHz phone or a newer 900 MHz model. Since the radio has been, as you
say,
TUNED, and I'm sure you are proud of that fact, it may now be putting
out
harmonics and that is what is nailing the telephone. Consider buying
your
neighbor a 900 MHz phone. Consider having your radio DETUNED.

Your neighbor's electronics are all Part 15 items, which by law must
tolerate all signals from other legal services. Your stock Washington
should
have been putting out a very clean signal, but now that it has been
TUNED,
all bets are off.

If you continue using the Palomar, there may be no hope for you at all
actually. I certainly don't recommend their use but if you insist, get
the
radio and amp to someone who can put it on a scope and look at all the
spurs
it is putting out and see if there is anything that can be done to clean
it
up. Otherwise, just keep using it and wait for the neighbor to call the
feds. If he calls often enough, you won't have to worry about how badly
his

electronics are being trashed.

I don't believe claims i believe what i have seen myself. Do you want to buy
a bridge i own 2 of them..

> Back in the 70's it was a COMMON practice to talk ground
> wave of 50 miles or better....on AM/SSB,
==========
back in the 70's there were many less people on the air, the noise level was
probably much lower but talking ground wave 50 miles is not as difficult
with a good vertical antenna mounted at a decent height outdoors on a
quiet frequency especially on ssb. But for you to act like you can go out
there and talk on am when you want with 4 watts am into a horizontal dipole
and talk ground wave .. I find very difficult to swallow...

>.......VERY COMMON as a matter of
> fact. I think some of the operators out here are selling themselves/AND
their
> equipment short....IT IS VERY PROBABLE (not possible) BUT PROBABLE, to be
able

......Best
> Regards, Frank in CT.

==========
I guess all the people i know who use dipoles because of antenna
restrictions etc are assholes since they cannot even talk 10 miles on AM
and most of them use amplifiers.

The first thing I would do it get two
good quality TVI filters, one for
between the xmiter and linear and one
after the linear. Also make sure the
base of the antenna is at least one wave
length above the ground and well
grounded; to local electrical code. You
night have the radio checked for
harmonics too.
Cheers,
John

Hello to all,
I need help picking the best mobile amplifier.I want it to have the lowest swr between the amp and
radio.Also one that will last when it is taken care of.I have been looking at a Texas star
a Train built and a dave made I need some input on these and any others.I am buying all my equipment new.

Thanks,

Genocide

Hello to all,
I am interested in getting a texas star sweet 16 or the hot plate.I was curious even tho these are
cw transmitters can they be converted to cb use.Also which texas star unit wud be best to
drive this with also where can I buy them new?Is there any web sites?also if any one has used these amps and have conversion info please send it to me.

Thanks,

Genocide

2577. Re: grounding question

Newsgroup: rec.radio.cb
Date: 2000-07-16 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <39724B20.472A5394@island.net>
Source record: 44557

A good grounded system consists of at least 2 10 foot ground rods with a double #4 copper wire, twisted together (remember RF resistance goes up fast over DC resistance). My 213 coax is run from the mask to with in 2 feet of the xmitter system and two #10 bare solid copper wires in the conduit with the coax ALL is grounded with each lead from the ground rods.

Inside I take off the conduit and 2 #10 wires with a 2 foot #4 welding cable to a 3/8"x2.5"x6" brass buss. From the each piece of equipment is grounded with no more than 14" of #6 automotive wire. All main copper/ brass contacts are soldered except the short #6 leads. There I use brass star washers and screws.
Cheers,
John

What, did a GOOD BUDDY stick something nasty in your A$$?? I wasn't SPOUTING as you put it! I seriously DOUBT Charles Gizmotchy is Back in the Antenna GAME, (although it would be a cute trick), Even IF someone HAS used his name for antennas, GOOD DEAL! Its a good design! However I don't think your response was called for! To the best of my knowledge The only Gizmotchy design being commercially sold is JoGunn! And if I'm wrong LA-DI-FUC#%$@-DA I Don't Live and Breathe radio! Never claimed to be a KNOW-IT-ALL , Although I do enjoy helping when i can! Since you Know of a Source for the Charles Gizmotchy Antennas Why not share it! I, as well as others would probably be interested!

> And of course you have never used your 2 meter rig on the freeway...

Aaron, you can't seem to be able to separate a cell phone from other stuff in the car. When a person is talking on a cell phone, they are concentrating both on trying to understand what the other person is saying (because of poor sound quality, static, and others) and trying to participate in the actual conversation.

This takes a considerable amount of attention. I know. I've tried to use a cell phone in a car before and found it extremely distracting. There is no way to listen carefully to the caller, participate in the conversation, and drive with even reasonable amount of attention to the road.

Because of that, I don't use a cell phone in the car anymore - I use my radio instead. From personal experience, I have found that the radio is far less distracting. Because I can turn up the volume, and the sound quality is generally better, I don't have to concentrate so hard at understanding what is being said.

In addition, I've found the conversation to be far more short, and more to the point with radio. Unlike the cell phone user, who often spends time gossiping, talking about what the kids had for breakfast, discussing business deals, or other nonsense, conversations on the radio are often far less involved (Hi, I'm on my way home. Be there soon. Okay? Catch you later.).

Other stuff in the car is also less distracting. The stereo has big buttons for changing memorized channels. The controls on the dashboard are large and easily worked (unlike a cell phone with the tiny buttons). And conversations with passengers don't require dedicated effort to participate. In other words, none of these items should distract the average driver like a cell phone does.

Anyway, I support the cell phone bans. I think they're reasonable and wise.

Ken,
A ground system does two things. It prevents or protects
you from electrical shock, and routes some types of unwanted
RF energy to ground. The 'hows' and 'whys' of grounding are
not always simple, and require more than a few lines on this
NG to cover adequately I'd suggest you try your local
library
to find books covering 'grounding', or there's quite a few
amateur radio publications that also cover this pretty well.
In a 'nut shell', it's to your benefit, and good grounding
never hurts...
'Doc

RedDragon,
I've got good news, and bad news, but first I've got
a question. How are you 'grounding' to a pine tree? I
don't
quite understand what you mean by that.
First the good news. Cordless phones are Part 15
devices,
as are TVs, and VCRs. As such, they are not protected from
RFI. Read the label on the bottom of the phone, the same
holds
true for VCRs and TVs.
Now the bad news. Your neighbor can 'get' you worse
tahn
you can 'get' him. Like it or not, the amplifier is
illegal.
Personally, I couldn't care less if you use it, but it does
put you between a rock and a hard place.
Another 'fact of CB life' is that the majority of
amplifiers
used on the CB bands are 'dirty', are not adequately
filtered.
There are ways of cleaning them up, but they aren't cheap.
The
simplest way to start is to use a 'low pass' filter on your
radio/amplifier. It probably won't make much difference,
but it's
a start. From there is gets a bit more technical and
costly.
One thing to rememebr, if this RFI turns into a
confrontational thing, you loose. Good relations are a key
to your continuing your hobby or not. So, I'd advise NOT
doing
a 'rambo' attitude thing on your neighbor.

You're right, Dwight. Hams don't try to understand each other and
rarely participate in an actual informational conversation. :-)

goto a cb shop , ask them , you will only get arguments here .

the best radio , amp , antenna depends on to many things .

best to sit down with someone who does this for a living and talk to them about it .

a better question for you to ask is " what shop have people had good experience's with in my area "

#22 north central illinois mobile

PLEASE......give it a rest, If you were to look at what I was commenting at, even you would understand why I lowered myself to HIS level, If anyone thinks Im going to just let someone TOTALLY insult me, they've got another thing coming. Ive ALWAYS conducted myself in a proper, positive, polite, RESPECTFULL manner, but theres NO-WAY im going to let ANYONE talk to me that way, Im not here to tell YOU or ANYONE else how to "flame" someone, do it YOUR OWN WAY and I WILL DO IT MINE.....case closed. Regards, Frank in CT.

Hell i did not need to curse him out to get my point across i just feel his claim is highly improbable considering it is a dipole in a condo on 11 meters talking 69 mile ground wave consistently . I have used horizontal dipoles, inverted vee's and a few other multiband dipoles and the centers were mounted on a tower 65 feet high. and a 10 and 20 meters dipole in the attic Unless he is on top of a mountain which he has not mentioned any mountain ranges in Conneticut... It is hard enough to talk 69 miles with a 4 watt radio and a 5/8 wave on am, And this is somewhat difficult unless the other side has a fairly large antenna or some height themslves.

What he was referencing here was a low pass filter which would attenuate the signal somewhere around and above 30 MHz. If there were harmonics being generated, the filter would clip them off. Certainly a 49 MHz phone would benefit if there were in fact harmonics being generated. The telephone's problem is more likely front end overload, but then that is another problem.

Are you trying to win support in your argument? It kills me.....your the kind of guy who needs to turn his god-damned linear on regularly to talk LOCAL, yet your the first one to try and disclaim anyone else of their accomplishments, "Only in America" I guess. The new breed of C.B.....what a beautiful thing, echo's, slapback echo, time delay echo, roger beeps, donkey farts, noise toys, linears, modulators, voice changers, robot voice, ...and Im the friekin nut that does'nt know anything???? "Wheres my time machine"....."Ive got to get the hell out of here".....70's.....here I come.....IM OUTTA
HERE.....

The Yearly gathering of the Normally Uncommitted Mp3 Boys
and Nihilist Uberstein Terrestrial Shortwavelisteners 69
(NUMB-NUTS) has voted unanimously to decree that Spike
Jones immortal song "Der Fuherer's Face" is herby attained
and confirmed as the official song of 3.950 SSB and it's
"alternate" 3.850 55 or 60 or wherever freq CLN's VFO happens
to lock onto that evening. NUMB-NUTS encouraged a healthy
listening dose of "Der Fuehrer's Face" prior to listening to 3.950
SSB. This will enrich your private listening pleasure immensly.

An MP3 copy of this Classic may be downloaded at the URL below.....

http://spikejones.homepage.com/jones.html

Note: you will also need a MP3 player software. We reccomend
WinAmp at: http://www.winamp.com/getwinamp/

Thanks to all that replied especially Bill K.
The counterpoise was what I forgot this time, last time I did it I made the counterpoise 7 foot and it was ok but if 8 is better I will do that instead. I do not use wire for my guys I use poly braided rope.
The antenna (Spectrum99) is about 20 foot to it's base.

Off topic: My replies are not showing up so I am writing this as a separate post. I will try an alternate server next round.
Thanks
Mike

On the subject of Dipoles I have used them for years. I used to have one in my laundry room stapled to the ceiling in a "V" shape. The SWR was so low that several meters did not even move while checking it. I could talk about 20 miles on a normal day with it. It also took up to 300 watts without any troubles. My friend was amazed at this and we made one for him tucked under the eves of his roof (Also V shaped but vertical). He uses this wire dipole to talk 60 or so miles down the mountain to Redlands. His friends swear he is on a beam.
I really like simple things to make life easier.

>someone is pulling your leg...
>

Sir, No-one is or has pulled my leg.....Ive been involved in the radio
hobby
for some 26 years, I KNOW what works/and what does not. System
architecture of
anyones shack is of course a personal prefrence of the individual, but
for you
to say my figures are exaggerated......that is totally ridiculous, more
than
one person has RE: to this post making simular claims (RANGE).....are
they ALSO
not telling the truth? Back in the 70's it was a COMMON practice to talk
ground
wave of 50 miles or better....on AM/SSB, ...VERY COMMON as a matter
of
fact. I think some of the operators out here are selling themselves/AND
their
equipment short....IT IS VERY PROBABLE (not possible) BUT PROBABLE, to
be able
to talk long distances......GROUNDWAVE. I know, I DO IT EVERY-DAY,
......Best
Regards, Frank in CT.

if you know the frwqency of the his cordles telphone is operatoing on
you can cut coax cable for one fifht wave that frweqency. atach a neon
lite bulb to drain off the rf enegey. and bury thisd cable out side his
huose conected to the huose cold water pipeing. that shpould fix the
porblem and let you use up to 150 00 wats. fine 73 and qsb to you.
blutarsky can help.

A good modulator for cb use is the texas star modv Plus. This modulator used with a good swinging radio will produce 2 watt dead key and swing to 70 watts. Cleanly. I had this modulator hooked up to a sweet sixteen texas star amp And has dead key of 40 watts and swing to 1400. Clean to the ear also. Killer Pissed a lot of people off. Isnt that what its all about>

2625. Antron 99 on a van? Opinion please.

Newsgroup: rec.radio.cb
Date: 2000-07-17 00:00:00 UTC
From: notdareal@aol.com
Message-ID: <20000717011810.05019.00001927@ng-cg1.aol.com>
Source record: 44605

OK, I got a van and seeing that a van is a pretty big vehicle I am thinking of somehow mounting an Antron 99 (or similiar) as my antenna. Has anyone seen this or do you have any pointers? 1 thing that worries me is having all that RF right next to me. O yeah, if the A99 doesn't work out, what would be a good mobile antenna for my van and a good mounting spot? I was thinking a 102" straight whip on the back bumper. Thanks.

There is no way you can keep anyone from talking to you that way and if you have to get down on their level to respond then that simply means you are at their level..

> rarely participate in an actual informational conversation. :-)

Already addressed that in the message you quoted, Cam. You just forget to quote it in your message. I said, "Because of that, I don't use a cell phone in the car anymore - I use my radio instead. From personal experience, I have found that the radio is far less distracting. Because I can turn up the volume, and the sound quality is generally better, I don't have to concentrate so hard at understanding what is being said."

I continued with, "In addition, I've found the conversation to be far more short, and more to the point with radio. Unlike the cell phone user, who often spends time gossiping, talking about what the kids had for breakfast, discussing business deals, or other nonsense, conversations on the radio are often far less involved (Hi, I'm on my way home. Be there soon. Okay? Catch you later.)."

And, yes, I do know you were trying to be funny. But you had to take my comments out of context to do it.

I guess the answer is yes. You do use a ham rig on the freeway...

>This takes a considerable amount of attention. I know. I've tried to
>use a cell phone in a car before and found it extremely distracting.

If you are uncomfortable using a cell phone while driving, then that
is a good reason not to do it. But most people don't have that
problem...

All I ever operate when mobile is CW. Some might think that it would
be very distracting, but it's not. There is not much difference
between holding a key, a mike, or a cell phone...

To answer your question about locking out a channel from being scanned. Try a BC7XLT. It has the capability of listening only to CB band and you can have the scanner features you are desiring.

There are a few cb's that have the scan feature but it is just that. Scan. They also have some dual watch features on them but that limits you to 2 channels.

Truck or car or boat. Now I am not sure if you were to get a ham ticket and use some more sophisticated equipment if you could get the features you are looking for.

Good luck in your search.
God Bless.

Of course it is because the ham you are listening to requires no
concentration as he is saying nothing of substance.

>
> In addition, I've found the conversation to be far more short, and
> more to the point with radio.

Surely you jest. I never heard a ham get to the point.

Unlike the cell phone user, who often
> spends time gossiping, talking about what the kids had for breakfast,
> discussing business deals, or other nonsense, conversations on the radio
> are often far less involved (

That is well understated. Hams discuss nothing.

> Anyway, I support the cell phone bans. I think they're reasonable and
wise.

I support ham radio bans.
Ham radio woulld put you to sleep

Please visit my World Wide Web Site, you have never seen a page like it. You
will see:

1. Access to oldies mp3 (albeit on an irregular basis)
2. Really interesting answering machine messages
3. A blond naked chic being held by a female ham!.
4. A guide to the best ham pages ever.
5. Hear Ted Kennedy really screw up in front of Clinton
6. Actually sounds of Bill Clinton "after the lov'in".
7. The writings of me and others on ham radio, hear a typical ham contact.
8. The warm side of K1OIK, hear me speak, see me with famous people.
9. An amazing card game that will shock others
10. Pictures of me and my family.
11. Did common German's enable the holocaust?
12. See now the future of ham radio.
13. How to pass the A+ Certification

Burt Fisher
A Plus Certified Teacher of video, broadcasting and electronics
Net + Certified

18' antenna on a van would be interesting to see. Be tough to put in the
garage! Don't think it is very practical. I would go with the whip.

Customarily when you read a post and wish to respond to it on Usenet, it is beneficial to quote that to which you are responding to. If your comment is in the vein of "Oh, so what, this doesn't affect me.", the rest of us would like to know what it is that you aren't being affected by. Your comments, without the benefit of the quote from the previous post, is meaningless.

Thats a right Toll.
Also the relay has 3 sets of contacts
1 - Switches the antenna
2 - Switches the Mod B+ / Speaker
3 - Switches RX / TX voltages

So if the lights go red the
3 set is OK.

QuicFix 3.01 has all that
good stuff about the SSB858 PCBoard.

2657. Thru-Glass CB Antenna SWR Problem

Newsgroup: rec.radio.cb
Date: 2000-07-17 00:00:00 UTC
From: Chip <twhjr@uswest.net>
Message-ID: <2qGc5.141$Qd4.84703@news.uswest.net>
Source record: 44637

I purchased a very expensive SWR/Power meter to "tune" my CB antenna. I can receive fine, but cannot seem to get out. So I hooked it up, and I think it read forward somewhere around 8. No instructions came with it. Grounded the antenna and my reading looks around 5 now. Moving the wip up and down in it's mount has NO effect. Am I reading this wrong? All channels, reading look like a 5?

Two needles seem to intersect around 20 on power (Black scale) and 5 on the red arches?? Am I reading it properly?

Anything else I can do to get it lower?

2658. Re: Antron 99 on a van? Opinion please.

I have a friend that tried a 99 on his truck. It worked really well. The only problem he had was going under red lights and trees. I would suggest that you go with the 102" whip.

2659. Re: Any reason to increase the ground plane if.....

Newsgroup: rec.radio.cb
Date: 2000-07-17 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <XTEc5.29960$qS3.64705@tor-nn1.netcom.ca>
Source record: 44639

Anybody know if joining the tips of the ground plane together make much difference ? If the ground plane is arranged in a cross shape with the antenna in the middle of the cross, then that would create a box around the groundplane. It may also help strengthen the thing and make it a bit heavier to be able to battle the wind.

Maybe sitting the cross groundplane on some wire mesh would help fill in the gaps between the groundplane ? This maybe a cheap upgrade ?

Richard.

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $45.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $60.

Marantz Model 2220B: Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation. I would rate a 9.7. Also have original manual, in excellent condition. $175

AR Inc: Stereo Amp, All solid state. $100. Please don't ask the model #. I have been asked this many times and unable to locate on the name plate. The serial # is: AA002291. It comes with the optinal wood case the face is Gold Alumi. With the following controls: Mode selector, Bass, Treble, balance and volume. In the upper left corner is a red LED and on the bottom right is a normal/monitor switch. I would rate it a 7 on appearance.

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM only. AM not working. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $115 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

RS Pro 30 Scanner: Hand held 16 channel Digital scanner. Looks & Works good, but the battery cover plate is missing $35.

If you have so much going on that you have to have a phone with you at all times, you either need an office or to stay home.

No, nothing 'going on'. I get maybe 3 calls a month, but when I do,
they
are generally of an 'urgent' nature. At least, urgent to my 14 year old
daughter, and that makes them important.

Mike

Source record: 44663

Can anyone tell me who has the best prices on base amps? I'm thinking about a 500 watt unit. Also can anyone suggest a quality name brand. I once had a Texas Star and almost vomitted when I opened it up and saw how poorly it was solderered together. Needless to say I had many problems with cold and bad solder joints. I know these products won't compare to any of the amateur amplifiers but they are out of my price range. Many thanks in advance.

I'm an electronic technician and I once bought a Texas Star 500, I can't tell you how horrible it was put together, and I had nothing but problems with it becuase of bad solder joints. Take it from me, I work for a Department of Defence Contractor and I'm Military Solder Certified. This amp looked like it was put together by a 5 year old. I don't have any experience on other brands but I would never buy another TexasStar.

I had one of the Radio Shack "Thru-Glass" and it had a screw on the mount piece that is inside the vehicle. That raised and lowered the SWR. If yours doesn't have a tuning screw then it must be defective maybe a new will fix your problems. You will probably find it is a very poor quality antenna for CB, but I am not sure what your using it for.

I use a LiL' Will by Wilson and get good results for a short antenna.

Sounds like u bought a $150.00 Comet meter, and youre using it to test one
of those "cell phone" look-alike CB antennas ? Save the meter for when you
get a better antenna. You are gonna bang yer head all day trying to get that
antenna to work good... Try www.copper.com or www.bills2way.com to get a
basic idea of what your looking for in a mobile antenna.

The "forward" needle should rise to 3/4 of the
scale. The "reflected" needle should not move
at all. Reflected power is not good. This is wasted
RF in the form of heat or possibly damage to your
final amplifier in your radio. (expensive to fix)

Finally, GET RID OF the on-the-glass antenna.

They are totally useless and do not get your
signal out at all. Some can even crack windshield
glass in cold weather. Thru-glass antennas work with
UHF frequencies or higher, like what frequencies
cell phones operate on.

For CB, either drill a hole or run the cable thru the
window insulation channel. Get rid of the on-the-glass
antenna. They are ALL pure junk - period.

You might have to cut the whip 1/4 inch at a time, the manufactures
usually make these type antennas a little longer to allow for vehicle
variables. I had a radio shack cellular look-a-like that needed 1/2 inch
removed from the whip in order for it to come into resonance.

I use it on my Class A motorhome ... not trying to talk skip or long distances. It's made by Midland and there is no tuning screw. I did however have to cut-off the PL-259 connector to feed it through the dash. Would a no-solder connector contribute to bad SWR? It was one from Radio Shack that has a set screw you turn to make contact with the shield. I wondered if it is making contact through the vinyl wire jacket. Would that hurt SWR?

Source record: 44672

Chip,
Let' back up a second. What brand/model of SWR meter do
you have? It
sounds like a 'cross-needle' type meter, if so, one needle
reads forward
power, the other reads reflected power, and where they
'cross' usually
is the SWR.
The forward power should be as high as it can go (you
don't have any
adjustment of this, just reads output power of the radio).
The reverse power should be as low as it will go (you
make this change
by 'tuning' the antenna).
Where the two needles cross is the SWR of the antenna
system. You can
see that by lowering the reflected power, the SWR comes
down.
With the above in mind, re-measure and tell us what you
get...

Hippie Freak,
Sounds like typical operations of a 'broadbanded' output
amplifier.
It has to do with the design of the amplifier, they
optimized it for
the higher power option, probably because that's where most
people will
use it. The length of feedline is going to make very little
difference
in how the amplifier 'acts'. The 'fault' is in the design,
and there's
little to do without 'getting into' the circuitry. I don't
think you
wanna open that can of worms.

Richard,
I think you would be doing your self more harm than good. Adding
a perimeter wire, or the mesh, only increases weight and surface area,
which can be thought of as 'sail area' and thats one thing you don't
want more of.
There are no 'cheap' up-grades. Your antenna sounds like it's
working
as well as it can be expected to, so to do 'better', you'll need to
start
thinking about another antenna. Even then, don't expect any
'miraculous'
gain in signals.

Your not running the feed lines (from radio to amp to antenna) next
to each other are you? You may be getting enough 'leakage' to cause
the feed back(maybe).

I think most of the problems were in your head
because of your soldering background. Texas
Star amps are probably the most reliable mass
produced specialty CB amp brand there is.
Texas Star amps (especially the 4 device and
1 driving 4 units) have a home-brew look to
them because they are based on 2 device modules.
However, they have stood the test of time like
no other brand (almost 20 years) and are still
the most popular and well-known units overall.
Unfortunately, Texas Star doesn't have a line
of base amps.

> I know these products won't
> compare to any of the amateur amplifiers but they are out of
> my price range.

I suggest you explore the X-Force base amps.
They are biased into Class B (the ones where
the model designation ends in 12) and are built
well. Here's a link:
http://hometown.aol.com/CBs313/X_Force_Base_Amps.html

Is indeed strange. Texas Star amps I have found to be rather rugged (takes alot of abuse) and easy to use. Did you contact the place where you purchased it? What did they say? If you bought it brand new and it was faulty, I'm a little confused of why you would open it up instead of sending it straight back. Once it is opened up the warranty is usually void no matter why it was opened. I know of one tech here in the bay area who sells certain 10 meter radios AFTER he converts them and STILL gives a warranty. He puts a seal on the inside of the radio and if you are not aware of where the seal is located, it will be separated when the cabinet is removed, voiding the warranty. So far, the system works pretty good for him. Of course, you could always have received a bad unit. Those things do occur here and there.

well if i might get into this discussion mr smarty pants peek a boo,
the fact of the matter is this. nothing and i do mean nothing can take
the place of the proper number of alternators and batteries and maybe
some capacitors as well along with this. you of all people should know
this. the dead motor maul is a gimmick, nothing more and nothing less.
heck if you want to set your volts so that when you are under load, it
will compensate for the drop , then do it at the regulator for crying
out loud. this crap of saying that you can use a bigger amp than normal
and still have a stock alternator or whatever is an interesting concept
but a fatally flawed idea. for one thing you aren't going to do much
talking with those batteries being used to power the load, heck a eight

pill, for example, will wear them out, in no time . and that stock alternator will burn up trying to keep up with this larger than normal load. so that is my opinion. the only reason you are whining about this , is the fact that it is part of your little grub stake, manufacturing these things for chumps who want to pony up the saw mill dollars for a few dollars worth of components. that is my roger and i am back in the bushes, trying to stay cool,.....cd is out...

2720. Re: Antron 99 on a van? Opinion please.

Newsgroup: rec.radio.cb
Date: 2000-07-17 00:00:00 UTC
From: Mike Frye <km6ab@pacbell.net>
Message-ID: <3973D17C.2F9F7976@pacbell.net>
Source record: 44700

The Antron is about 18ft tall. A lot of overpasses are much less. Most 9ft whip installs on vans don't work either because the whip runs close to the sheet metal for about 6ft and acts more like a transmission line than an antenna. Put the biggest thing you can mount in the center of the roof and make use of the nice ground plane.

2721. Re: Dead Motor Maul

Newsgroup: rec.radio.cb

Source record: 44701

It will work, I don't sale the things but have made quite a few of them and they work, it is a time tested fact, What my local buddy CD is saying. It is a very good idea, if it is done right it is a good way for a guy with alternator limitations to get the current requirements he needs, now I in no way believe they are as good as alternators, but if the "maul" is built correctly and is not lacking in the amount of parts it needs to be operated @ 100% duty cycle it will work without any problems. It requires that you have a large battery bank and at least a hundred amp alternator. I have seen some of the other motor mauls that people have had that to me were way under built.

Source record: 44706

yes it would they are bad for that! I wouldn't used that type pl-259 on
a radio because it doesn't make a good connection on the coax cable. If
you are having hight swr not only should you replace the pl-259 also
check the coax and the ant...

the lowest swr has to do with the ant not the amp or you need to check
your coax. as far as the swr between the radio and the amp if you have
a good jumper"most of the jumper are around 3ft. should work just fine"
the only time that the swr goes up between the radio and the amp is if
the jumper is bad or if something is wrong with pl259 or the so239 in
all the years the i have been in radio almost 20 years now a ham
operator for 10 and have a deg. in electronics. I have found that most
people that tell you that it make a difference but i have found that
you can't tell without a meter (from 1 jumper to another)when you look
at the lost per hundred ft. you can't see it in your output from the
back of the radio or from the meter on your radio. so if you have a
good jumper not one of those $2 job i'm talking a good one that is made
out of good coax with good pl-259's if you put the swr bride between
the radio and the amp you aren't going to get a good reading i don't
care what people tell you

also i forgot if you got a good radio you don't need a amp. but if i
was going to buy a amp i would take a good look at my ant.. i feel that
you are better off with out the amp if you want talk dx you should
thank about becoming a ham operator. it's all what you want some people
don't want to become a ham they just like CB radio and that fine

I currently am using a 5 element flat side and am thinking of going to a quad. From what I understand is that a quad is a full wave, so instead of adding on to what I got maybe I should go quad? Will I have better results then going with a 7 or 8 element flat side?

Thanks Doc ... funny, I finally called Midland, maker of the thru-glass antenna I am using, and their tech told me that I cannot measure SWR on ANY thru-glass antenna because I am not physically connected to the rod. Field Strength Meter is the best way to tune. I sure have had a several people tell me they can be tuned ... I will change the connector and see if it works any better.

the best overall antenna to run . it has to be the 102 inch whip with a 6 inch coil spring. ask the boys in the mini grass what they run. they will tell you. and they get out pretty good with those 8 pill davemades. now the 102 inch whip is very forgiving when it comes in contact with a tree limb. now if you want to go somewhere and talk skip, then switch over to the 55 antenna, but please don't run around town with it. those babies are very nice and i would hate to see you break it,.....cd is out..........

It's from static build up and discharge on the antenna that is caused
by the rain droplets hitting it. A DC grounded type of antenna is less
likely to exhibit this type of noise in the rain. Another method of
reducing this static is by the use of a radios that incorporates a
good noise blanker. In some cases a good noise blanker will be
able to eliminate 9 S-units of this type of noise.

I'm not trying to get in the middle of ya'lls dispute, but the motor maul disconnects the alternator during key up. Everyone says that it's the batteries that do the job. If this is the case, then why wouldn't this work?

You will not be able to get the match down with that antenna. It's way too
short and will not resonate well at 27MHz...

You need to get another antenna.

No kidding... stop the presses... lol
It's no secret that all the amps out there are thrown together. There is absolutely no quality control whatsoever.
That's why people pay two to three times the price for one of my amps. The quality is far above anything out there... but the price isn't for everyone.

Hello Professor & Doc & JR: Again, better go look up PEP and RMS definitions.

This is a quote from Eimac's book "The Care and Feeding of Power Grid Tubes", page 59, second printing 1976.

"Peak Envelope Power (PEP) is the root mean square (RMS) power generated at the peak of the modulated envelope"

Maybe what you guys are thinking about is Peak Instantaneous Power (PIP) which is generated at the peak of the modulation envelope. Transmitters, amplifiers, coax, and antennas must be able to withstand these instantaneous peak voltages and currents.

Do you think the industry would allow for a peak instantaneous peak power rating, or a average peak power rating in a modulation envelope?

Why do think Peak Reading Wattmeters read the same as a Avarage Reading Wattmeter, for a unmodulated carrier?

Jay in the Mojave

I you want a good groung just use four 3'section of bamboo. Cut a 45 on em and shove them in the ground! Bamboo has some great qualities too it! Lots of strands to it! lOOK For 8-4 agw in bamboo, stay away from the Pandas they will fight to the death for the stuff! Now tie all sections together with horse hair again multy strand(bowStringviolin)or if you feel froggy clip from a horses ass! You must wash it before install to get the clingons off of it!

Some say of you live in the south just tie your ground to grandma's grave (casket is an old copper bath tub grandpa buried her in)! P.s Don't be pissin on this grandma will getcha!

> A good modulator for cb use is the texas star modv Plus.

I prefer the Modulator Plus. Kill that fuckin variable knob. Very few of the CB
radio crowd properly know how to adjust it and use it neway.

This modulator used
> with a good swinging radio will produce 2 watt dead key and swing to 70 watts.

That modulator with a bone stock radio should key at the same as the radio carrier (if
the radio keys less than or at 4 watts) and PEP over 80.... Sean and I argued about this
and the only ones that DIDN'T do these numbers where the originals that utilized the
MRF455 transistor. From their TS went to the 2SC2290, and it should do near 120 watts
PEP.

> Cleanly. I had this modulator hooked up to a sweet sixteen texas star amp And
> has dead key of 40 watts and swing to 1400.

Damn, my Sweet Sixteen does 2400 PEP Bird, with a Mod + driving it.

My guess is yours is either stock, or screwed.

Clean to the ear also. Killer
> Pissed a lot of people off. Isnt that what its all about>

If it was clean, how did it piss someone off? Or are you one of those that believes he needs
a Sweet Sixteen to talk to his neighbor, and plugs ears a nundred miles away for no reason
whatsoever?

Source record: 44783

> Hello to all,

And a fine hello howdy do to you!

> I am interested in getting a texas star sweet 16 or the hot plate.

For the small difference in price, get the sweet sixteen. You get
transistors rated at 50 perccent
greater output with the same input. What does that tell ya?

I was
> curious even tho these are
> cw transmitters can they be converted to cb use.

Yes, with a very simple modification. No tech should even need instructions
for it. If they do, go
elsewhere, as you have a screwdriver wizard who knows how to read.... And
not much else.

Also which texas star
> unit wud be best to
> drive this with

Depends on what you want?? AM only, get the Modulator plus. AM / SSB, get
the Texas Star
250, and run it on a lower power setting (like with the SSB switch pushed in
at all times).

Keep the carrier down to about 20 watts (Texas Star says 30, I prefer 20...
Whatever you do,
keep the carrier out of the 16 at 350 watts or less, and use a fan).

also where can I buy them new?

ExportsrUs is the best bet.

TollHolio

Is there any web
> sites?also if any one has used these amps and have conversion info
> please send it to me.

No.

Take it to a reputable shop, have the entire mess tuned together into a
dummy load, and then
have the shop make sure you see the same thing into your antenna.

Am I being a prick? Maybe, but you will be better off in the long run by having someone that can do
the modification by looking at the board(s), rather than a screwdriver wizard... Or you will be buying
transistors on a monthly basis.

Also, you need a seperate alternator for that amp. A leece-neville will do you fine. A good rule of thumb
is to get a 165 amp alternator for every 8 transistors you decide to run.

The Sweet Sixteen can live fine at 15.5 volts, if you increase the value of the bias resistors by about 15 to 20
percent.

Hope this helps.

If you want SSB use, get either a Texas Star or a Messenger.

If you want AM only, and don't care about spectral purity, get a DaveMade,
Cookie Built or Pirate. I would choose the Pirate last, though.

> Could a no-solder PL-259 connector contribute to high SWR if improperly
> installed?

Absolutley. All it takes is some corrosion
within the center-conductor pin via moisture
or some other contaminate and the oxidation
resulting will form an insulator of "gunk" between
the center conductor of the coaxial cable, and the
inside surfaces of the cylindrical tube to which
the same is threaded into/thru.

Also, if you are using any type of "on glass" or "thru glass"
antenna, junk these also. They do not work and contribute
to poor VSWR. The best antenna you can use for mobile
is a permanent antenna mounted dead-center in the roof
of the car (drill thru mount) or a magnetic mount placed dead
center in the middle of the roof.

> works any better.

That seems odd. If you can't measure any reflected power
from the antenna, you can surely measure forward power. If you
have forward power and no reflected, then the SWR should be 1.0:1,
no matter what the frequency. Using an SWR meter, it should show
to be a 'perfect' antenna. Think something smells about that
explanation....

No... reflections are a function of standing waves on the transmission line. However... you can have a poor impedance match from the output device to the coax/antenna system. This is not a relection problem but one of poor matching between load(coax/antenna) and source(transmitter). In this case... your SWR may be excellent... you have little or no standing waves on the line... but you will still not be able to get the power from the transmitter to the antenna effectively.

I had heard that signal engineering did not exaggerate their antenna specs like some do, I heard wrong. They claim their quads have a 2 db gain over a yagi with a like number of elements. This is only true for a 2 element quad. The best estimate is that a quad has about the same gain as a yagi with one more element than the quad. This is true out to about four elements, gain is about the same at 5 and at 6 the yagi passes the quad. The practical gain limit for a yagi is about 14 or 15 dbi with over 20 elements. The limit for a quad is about 11dbi and comes at five elements. Not saying anything bad about thier antennas but I would never buy a quad with more than 5 elements. Boom length for this size antenna should be between 30 and 20 ft long.

Source record: 44715

Let's take a minute to consider the thru-the-glass antenna. How long is the actual antenna that is standing up? Remember now that CB is on the 11 meter band. A full wavelength antenna is roughly 408 inches long. Antennas, to work optimally, should be cut at 1/4, 1/2, 5/8, or full wavelength, or longer in multiples. The shortest length mentioned here would be roughly 102 inches in length. Any antenna which is shorter than this has designed problems built into it and although might be electrically a quarter wavelength, still isn't going to get out as well as a true quarter or half wavelength antenna. There are tradeoffs with all of these antennas. Not everyone can have a 102 inch whip on top of their car or truck. With shorter antennas come compromises. Now, that little thing glued to your glass is resonant on 11 meters because it probably is terminated with a capacitor. You can feed almost any length of wire and terminate it with a 34 pF capacitor and it resonate on the CB band. If there is an adjustment to it, it simply means that there is a variable cap in there and is be adjustable between 33 and 36 pF. Just because it is resonant doesn't mean it is getting your signal out. Just to remind you that dumby loads are also resonant.

Get rid of the glue-on and get a real antenna. They don't have to be ugly.

PART 95--PERSONAL RADIO SERVICES--Table of Contents

Subpart D--Citizens Band (CB) Radio Service

Sec. 95.411 (CB Rule 11) May I use power amplifiers?

(a) You may not attach the following items (power amplifiers) to your certificated CB transmitter in any way:
(1) External radio frequency (RF) power amplifiers (sometimes called linears or linear amplifiers); or
(2) Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.
(b) There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.
(c) The FCC will presume you have used a linear or other external RF power amplifier if--
(1) It is in your possession or on your premises; and
(2) There is other evidence that you have operated your CB station with more power than allowed by CB Rule 10, Sec. 95.410.
(d) Paragraph (c) of this section does not apply if you hold a license in another radio service which allows you to operate an external RF power amplifier.

[48 FR 24894, June 3, 1983, as amended at 63 FR 36610, July 7, 1998]

Effective Date Note: At 63 FR 36610, July 7, 1998, Sec. 95.411, paragraph (a) introductory text was amended by removing the term ``type-accepted'' and adding in its place ``certificated'', effective Oct. 5, 1998.

well you can definitely talk but you can't talk indefinitely, that is
my point, now if you are long winded and you get a verbal altercation
with a duck, you want to have your stuff ready so you can do the job.
well battery power falls off fast, especially if you are pumping the
watts. then you have to lay off of it while it recharges. a interesting
gimmick, but for me , i never have had any compunction to go and buy
one , but to each his own i guess. personally i like unlimited keydown
time if possible and if you have the juice and you keep those 2879s
cool while under load, then you can talk for a while,.........cd is
out........

> "Peak Envelope Power (PEP) is the root mean square (RMS) power
generated
> at the peak of the modulated envelope"

that's true...but.............

The "RMS" quoted here and the RMS of a signal are not the same. This
is only explaining that PEP is the "average" of power with MODULATION.
This is not the same as RMS as in an unmodulated AM carrier.

Greetings all,

I tuned a Firestik II a couple of weekends ago, and got the SWR as best as possible on ch 1 and ch 40, and when I put on the flexible plastic cap, the reading jumped to almost 3:1. Took it off, checked the SWR, and it went back down to the tuned value. Anyone have a similar experience? If so, what did you do, if anything, to work around the situation?

Sounds like that rat shack's techs are as poorly informed as the sales droids in the stores.

The tech is absolutely wrong.

:> Strength Meter is the best way to tune. I sure have had a several people

I always use a field strength meter for tuning antennas. They ARE better than SWR meters. See Deja News for archived posts on why.

:> tell me they can be tuned ... I will change the connector and see if it
:> works any better.

A bad connector can certainly cause a problem. However, as others have said, you are pretty much wasting your time using that antenna. It will probably radiate only a few percent of the power fed into it. The rest disappears as heat.

Generally speaking, powerline noise is worse on DRY days... wet, rainy days make the path to ground lower in resistance, decreasing the arcing.

>service that allows you to use an external amplifier
>

No, it says that you, as a license holder in another service, are exempt from presumption of illegal use of the amplifier in question if it's found in your possession.
The fact of the law remains (as ever, sigh!) that NO ONE shall OPERATE on the Citizen's Band above the FCC mandated power levels, REGARDLESS of license for another service.
An amateur may not use an amp on the Citizen's Band, a CBer cannot either, neither can Elmer Fudd, okay? NOBODY.
It happens all the time, of course. That's another issue. But Section D does not change that fact, it only says a licensee is not subject to automatic assumption of guilt if an amplifier is found in his possession.
Linus

> the lowest swr has to do with the ant not the amp

This would depend on WHERE the measurement was taken.......

or you need to check
> your coax. as far as the swr between the radio and the amp if you have
> a good jumper"most of the jumper are around 3ft. should work just fine"
> the only time that the swr goes up between the radio and the amp is if
> the jumper is bad or if something is wrong with pl259 or the so239

That is not the only time the radio will see a HIGH SWR, internal
problems with the amp CAN AND WILL Change the SWR the radio sees......

in
> all the years the i have been in radio almost 20 years now a ham
> operator for 10 and have a deg. in electronics. I have found that most
> people that tell you that it make a difference but i have found that
> you can't tell without a meter (from 1 jumper to another)when you look
> at the lost per hundred ft.

Typically this is true, however when running an amplifier various factors
can cause the patch cable length to be critical.... If the Amp is stable,
grounded well, and well designed, then it usually makes no difference,
however some of the crappy designed CB amps will cough on the wrong length
of coax.... Certainly Loss from cable length is NOT an issue, other
factors CAN make length an issue......

you can't see it in your output from the
> back of the radio or from the meter on your radio. so if you have a
> good jumper not one of those $2 job i'm talking a good one that is made
> out of good coax with good pl-259's if you put the swr bride between
> the radio and the amp you aren't going to get a good reading i don't
> care what people tell you
>
>

Well either way, if its a typo and you meant "are going to get a good
reading" This is false, if the Amplifiers impedance match is not right, it
will show show on the meter, and can affect performance..... if you meant
"aren't going to get a good reading" that would also be false, if the radio
sees the proper load from the amp the SWR WILL be good.....

2811. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8l11rqgti1@news.hawaii.edu>
Source record: 44741
Cross-posted to: rec.radio.broadcasting,rec.radio.cb,rec.radio.info

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Come to the rainy west coast and see for
your self. As I CATV tech I have been up
poles that been doing that. It is mostly
the poles with the Ground on them witch
is roughly every 4th pole here. BC Hydro
has a Van with a Plexiglas dome on it,
equipped with an infrared camera for
spotting these hot spots. They say they
loose thousands of watts from leakage
like this.
Cheers,
John

I apologize if I offended some TexasStar users out there but I needed to voice my opinion on my experience on them. Over the weekend I purchased new a DaveMade amp at a local hamfest. After getting home I connected the amp, turned it on and the power L.E.D. did not turn on. Here we go again I said to myself. I opened the unit to do a little troubleshooting and saw that the L.E.D. had a bad solder joint and was not making contact. After properly soldering it back on I brought the unit under a high power 6 inch magnifier to inspect the rest of the circuitry. Not to my surprise I found another problem. A resistor placed between the power adjust pot and the circuit board had NEVER been soldered! So my friends do you see what I mean when I say these things look like they're put toghether by a six year old! If theses companys wish to claim they make "the best" product they need to spend a little money and hire experienced assemblers and quality control inspecters. I remember an old ham once ask me "when are you going to stop spending your money on that c.b. crap, it never works" I'm starting to realize this today. You know what they say, "one mans trash is another mans treasure" I'm going to save my money and buy an Ameritron. 73's

well let me tell you this my friend.
i i posted all the prices on everything at one time
and guys like you said there must be something wrong with the
products. well this is all wrong. you see their is a lot of shops
out here that buy from outher shops and they have to mark up their
products in order to make a profit also.
and some shops buy from dist. and the mark up still goes up.
then theirs shops that are fulley licensed and buy from the factory
and with the low cost we pay and with the slight make up we have to do
to make a profit to help pay the bills we can sell our product's
cheaper then anyone else. do you see a picture forming here.
you have to remember this . this is a dog eat dog world.
and only the big dogs get to get away with this.
so the next time you go to a web sight and there is no prices don't
run them down and send them an e-mail and ask whats up.
im sure they will get back to you and you might find out that you are
missing out on some of the best things you want and at the best
prices. so please don't put your foot in your mouth again
and give them a try.
nuff said for now you all have a good day and God bless

I have never used a no-solder end. The center conductor has to be isolated
from the outside shield. The center conductor must make a solid connection
when screwed into the radio. This is why it is easier to use regular ends.
They are not hard to learn how to do. Just couple of trys on a scrap piece
of co-ax and your an expert!

Use an ohm meter to check conductivity . Use the ohm meter to check that
the braid is isolated from the center.
Someone else suggested that you should cut the whip to gring down the SWR I
wouldn't. The antenna is designed to work at that length.

2819. Microphone Wiring Question

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: Barry D <x123x123@yahoo.com>
Message-ID: <NqYc5.186498$7o1.4612996@news2.rdc1.on.home.com>
Source record: 44799

I am wondering if I can hook up a Kenwood MC-85 microphone to a Uniden Madison base station. I have got all the wires figured out but I am un-sure as to what the "RECEIVE" wire does is on a CB microphone.

Since this is an amateur radio microphone is it not compatible with CB radios?

This is the wiring summary fro the Kenwood MC-85

Pin # Colour Function
---
1 White Mic Output (w/t unshielded ground)
2 Red PushToTalk
3 Brown Down Button on Mic
4 Blue Up Button on Mic
5 Green Ext Power 8.4V DC
6
7
8 Black Ground

The mic also takes batteries to supply power if the radio doesn't have a DC supply in the mic wiring. I know the #3, #4 will be not used because my Madison doesn't support that feature.

I can't seem to find the mic wiring schematic for the Uniden Madison anyone have it?

Thanks for reading.

I agree with Professor, you can't expect very much from grounding to a tree. It is attached to the earth but is not a good conductor. Use an 8' copper coated ground rod attached and very close to the antenna mast. You can also try to cut down on the mic gain to the bare minimum for contacts.

RFI solutions are often in the Doc's that come with your antenna. What kind of antenna and how high is it?

Marconi

"22",
No, they are not the same. SWR if a ratio of forward power to reflected power. To find SWR the meter measures the forward power (going to the antenna) and the reflected power (comming back from the meter). It compares the two and expresses their relationship in 'SWR' units on the meter.
No, you can not have low SWR and high reflected power in any normal/standard radio, feedline, antenna system.

Well, I'd have to guess that your hearing a combination of
the normal band noise plus 'rain' static. The only other thing
I can think of is that you may have a 'bad' connection somewhere
and the rain is 'making' the connection, making the noise stronger.
I don't think that's very likely, but... (?)

What a self-serving, asshole paragragh
that was.

The truth is that Griffey is afraid to
sell any of his "creations" to anyone
he can't trust for fear that they might
send it off for unbiased testing.

Then, the fact that his "toy" amps are
no better than average in any way would
be common knowledge.

Anyone who has looked at the pictures
of his one-device amp knows that it's
nothing special or out of the ordinary
at all. It's a copy of a 26 year old
Motorola test circuit.

Griffeys amps are not leading edge designs,
they lack features, are made from average
quality parts, and the build quality is
average. The quality is definitely not
"far above anything out there," and they
are certainly not worth 2 or 3 times the
price of any other typical, daily-use amp.
Anyone who buys one of his amps is a sucker
who fell for his bullshit.

Im looking for owners of the rare "hand wired" D201 radio, If any of you are out there.....please contact me, I would like to do a comparison of specifications/performance. If you decide to contact me via e-mail, please leave me your name and number, and I will contact you within a week or two, after EVERYONE has finished contacting me, and thanks for reading this post.....73, Frank in CT.

2832. High Power AM Stations - I don't get it ??

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <m0%c5.30818$qS3.66043@tor-nn1.netcom.ca>
Source record: 44812

Can anybody explain to me the purpose of running high power on AM ? If you want distance, then surely SSB is the way to go. I thought that AM was less efficient than SSB.

Up here in Canada you can regularly hear guys in the US running ridiculous amounts of power on AM, which causes them to completely block LSB and USB of the channel they are on, and quite often the channels either side. Or is that the intent ?

Thanks,

Richard
9013 Ontario Canada

Chip,

I would advise against the through glass type of antenna from what I have read (I asked a similar question a while ago). As most people will tell you, an antenna mounted in the centre of the car roof is the best, but being as you are trying out a through glass antenna suggests to me that you may be looking for something discreet to save spoiling the look of your car (or to keep the wife happy).

You could try a small K-30 mag mount or even a Wilson Little Wil mag mount antenna. Both are small, relatively cheap, can be mounted on the trunk lid without any drilling etc. and will work much better than the through glass antenna you are fighting with.

I have a K-40 mounted on my trunk lid just behind the rear window. It's not as intrusive as having it mounted on the roof, but there is a trade off with it making the signal a bit more directional to the front of the vehicle. It works superbly, and the SWR is quite good (approx. 1.15:1 at the higher channels where I operate). Your best bet would be to pop down to a local CB shop and see what other antennas they have. I suggested a couple but there are many more styles/shapes available.

Let us know how you get on.

Good luck !

Richard.

Jay in the Mojave wrote:
>
> Hello Professor & Doc & JR: Again, better go look up PEP and RMS
> definitions.
>
> This is a quote from Eimac's book "The Care and Feeding of Power Grid
> Tubes", page 59, second printing 1976.
>
> "Peak Envelope Power (PEP) is the root mean square (RMS) power generated
> at the peak of the modulated envelope"
>
---clipped------

Jay,
When dealing with the power of a simple sine wave, here are the
'standard' relationships;
rms = 0.707 x peak or peak = 1.414 x rms
avg = 0.636 x peak or peak = 1.57 x rms
peak = 0.5 x pep

When dealing with determining the output power of an transmitter
fed with a two-tone signal, 'Peak envelope power' is commonly
defined as twice the average power input of the transmitter.
So, if your comparing the rms power input of a transmitter to the
PEP power output of the transmitter employing a simple sine wave as
input to the transmitter, you are correct. In the same situation,
except using a complex wave form, or two-tone signal as input to the
transmitter, you're incorrect. The reason is that a voice signal as
simulated by a two-tone signal, has a peak to average power ratio of
two to one. A voice signal has a very complex and varying Peak to
average power ratio, sometimes varying 40db.
'Doc

You'll be dissatisfied with Ameritron too. They are of no better quality than Dave Made or Texas Star. They don't perform any better and are overpriced because they include elaborate protection circuitry (that often causes problems) and band-switched tuned output circuits. (I'm talking about their solid-state units.) The tube units require high drive and are built to a price point; therefore, they won't be satisfyingly military-like in their quality and may not be compatable with your radio either.

Your best bet would have been to rework all the solder joints in the Texas Star until you were satisfied that they were up to your standards, then buy an Astron power supply (rework all of its solder joints too) and a nice low-pass filter (of course you'll need to rework all of its solder joints) so that the Texas Star would function as a base amp. The Texas Star 500 design is solid and its performance is above average. I've put alot of them in service. I won't deny that I've seen a few that had factory defects (missed solder joints, shorted keying circuit transistors, defective lamps, stripped cover screws, etc.), but once the minor problems are handled the amps hardly ever come back. In other words, if the unit works when put into service, it continues to work for a long time. I've never seen one that worked properly when put into service that developed a problem due to a cold or cracked joint. The only solder joint related problems I've repaired are caused by overheating the amp. In other words, the amps are run until they are so hot that the solder softens and parts literally fall out. That in itself says something about the durability of the Texas Star designs. It's not uncommon in a case where the amp was overheated to the point where parts fall out to simply put the parts back and have the amp work again. If the design was poor and the amp was unstable, the power transistors would thermally run away and fail long before the amp was hot enough to melt solder.

The bottom line is that you had a nice amp in the Texas Star. I believe you prejugded it based on it's appearance and a minor factory defect. The fact that yours had a defect should be blamed on the dealer you bought it from rather than the manufacturer. Too many dealers just hand off boxes to make money. In other words, they don't take the time to test anything--they just put one box in another box and ship it. The other side of the coin is that the dealers that test

every unit and repair any defects (like myself) charge more.
That's just the way it has to be. In any case, the Texas
Star 500 is a great value (maybe even the best value) when
it comes to broad-band, solid-state HF amps. You'll eventually
come to realize that.

Some people are simply on a power trip. They don't care to communicate, they just want to be heard. As long as it is loud and splatters all over the band that seems to make them happy for some strange reason. And yes, SSB is more efficient than AM With AM the total power is divided between the carrier and the two sidebands with most of the power being in the carrier which contains non of the intelligence as the sidebands carry the intelligence. With SSB all the available power is transmitted in one sideband.

Unless Steve has changed his keying circuit, a Pirate amp won't have a super low SWR between the radio and amp. Steve normally uses large TO-220 cased keying transistors that don't have alot of gain and require a relatively large RF sample. Getting the larger sample means the keying circuit isn't invisible. An input SWR of 1.5 to 2 is typical of amps using that keying circuit design.

I agree with your recommendations except that I would omit Pirate if input SWR is super important, and I would rank Texas Star ahead of Messenger. Also, I would include the Blue Face amps in the SSB use catagory, and rank them ahead of Messenger as well. X-Force deserves a spot in the AM only list. I'd rank X-Force ahead of Cookie or Pirate too.

In the high-end systems it's the alternator(s)
that carry the majority of the load. The batteries
and capacitors are buffers. Without the alternator(s)
the system will be limited as to voltage (performance)
and transmit time.

Hello Richard in the great (soon to be white?) north! Propagation has plenty to do with it as well. Here in the 'pile, we hear you guys with great regularity, especially Ontario, with signals up in the 'patch. We have had bleed 1 or 2 channels away from where the operator was and several times the reverse has been true. At times, propagation is so strong between us and Canada that we think each other are local or as you stated, running power, when that is not always the case. There is merit to what you say about high powered ops., but when the DX is running strong from your way, we can hear you guys a channel or two away also, but it is nothing you can't tune out most of the time with good rejection. If you don't have a beam, all the more reason to get one.

Any problem using a 4 ohm instead of an 8 ohm for an external speaker on a Uniden PC76XL with talkback? Was going to use an old Uniden SP-1 but it's marked 4 ohms & manual says use 8? I'm new to this subject. Thanks!

> 102 inches in length.

And it requires a ground plane to form the other quarter
wavelength. Thru-glass antennas have no ground plane, so
they must attempt to emulate an end-fed halfwave (an 18
foot antenna).

> Any antenna which is shorter than this has designed
> problems built into it and although might be electrically a quarter
> wavelength, still isn't going to get out as well as a true quarter or half
> wavelength antenna.

An end-fed halfwave has a very high feedpoint impedance
and an 18 foot resonant length. That's a tough act for
some cellular look-alike piece of crap to follow.

> There are tradeoffs with all of these antennas. Not

> it is getting your signal out. Just to remind you that dumby loads are also
> resonant.

Cellular look-alike, thru-glass antennas are like
soldering a wire to a 50 ohm resistor and using
that as an antenna. There will be some radiation,
but most of the power is converted to heat.

> Get rid of the glue-on and get a real antenna. They don't have to be ugly.

A better choice than a thru-glass is one of those
duplexer boxes that allows the CB to share the AM/FM
broadcast radio antenna. A typical car radio antenna
is about 31 inches long (a quarterwave on the FM broad-
cast band) and has a real RF ground. That's sure to

outperform a thru-glass, and is totally invisible
from the outside.

I think your interpretation is wrong.

Re-read the statement from the Eimac book
and think about it. It's tricky because
it involves an instant in time. We're
used to looking at values that are averaged
over longer periods of time

PEP equals RMS at any point in the envelope
IF that power level were equated to a constant
waveform (like a carrier). At the peak of a
100% positively modulated 40 watt RMS AM signal
the PEP is 160 watts--which would equal the
RMS of a constant amplitude signal over an
infinite amount of time. In other words, using
a 100% modulated envelope as an example, during
any INSTANT the PEP and RMS are equal but not
when averaged over the period of one or more
cycles. That's why the PEP and RMS of a carrier
are equal--because when averaged the PEP doesn't
change over time.

The solderless connectors work IF the instructions are followed
to the letter AND the connector isn't put under alot of stress
(the coax isn't bend to a sharp angle right at the connector and/
or forced to deal with repeated loads like tugging on it or having
the radio hang from it). In other words, if it's installed right
and left alone, it'll work.

I got my SWR down with my cell look-a-like magnet mount....I had to cut
some off the whip (per instructions) before it was any where near
resonating. All I care about hearing is what is close to me (+/- one mile).
So for this application it works great, and doesn't look like a CB antenna.
As stated in another post, stay away from the tinting on vehicle windows.

> good?

Yes, they were good. Many people still use them.
However, buying and using one now is a roll of the
dice. You could easily be buying someone else's
problem. The tubes and power transformers are not
cheap anymore. Even with one that's been stored
since the 70's, the power transformer could fail
due to moisture. I don't recommend that people
actively search them out unless they realize the
chance they are taking and what they are getting
themselves into. If they are willing to take the
chance, and they find a good one, the old amps are
a good deal. For example, I have a PAL 321 (same
as a Skipper 300) for sale priced at $250. A new,
low-drive, 600 PEP watt base amp of decent quality
will cost more than double that. On the other hand,
at any time a tube could short in the 321 taking out
the plate choke and the power transformer before the
fuse blows. You have to weigh the initial savings
against the potential risk and make a decision.

true the goverment do used frz. below 26.5 and they used from 27.5 to 28
also but people used this band and something that you should know some
cb operator used the 29.7 - 30 mhz also this is above the 10 meter band
even tho you need a lic.. to used this band cb operator used it. and i
have heard of cb operator using packet(hooking a pc to their radio with
a tnc it is used a lot on the ham bands) in us cb fm isn't used that
much most people don't know much about it so they don't used it. they
get these radio for the ex ch.. on the other hand fm cb isn't legal.
legal use of cb radio in the us is 26.965-27.405 am/usb/lsb in the US
and as far as enforcement of the band true the FCC don't but that don't
mean they willn't check up on it. most of the time they only check up
on you if you are having tvi pro.. and if someone report you them it
hard to get them to get moving on "ha ha ha "lol. i have used the cbfm
before and it is a good mode to used

Richard, Twistedhed puts forth some very valid points.... I've heard SSB Signals 2 and 3 channels away, Operators on the opposite sideband typically tear up the frequency as well! Yes SSB is more efficient (slightly) However why do you suppose AM Broadcast hasn't gone to SSB? one word FIDELITY, I prefer AM, no matter what radio, filters, tuning, etc... SSB always sounds UN-NATURAL, it simply lacks the fidelity available on AM!! Where I am located its normal to talk 35-50 miles base to mobile, and SSB does not make a whole lot of difference....

Here's one: http://www.cbcintl.com/images/LINRSCHM.GIF
Use the larger caps recommended for use with MRF421s
and include R3 and R4 to prevent overdrive.

Here's another one:
http://www.texasstar.com/350HDVschematic.gif
With this one your best bet is to employ the
basic power amp, pre-amp, and keying circuits,
then adapt your own input swamping and control
switch circuits.

Thanks for the advice Bill but do you understand what I'm
saying? Of course I don't expect to find any mil-spec amps
at those prices. The reason I wrote I was mil/solder
certified was to let people know of my integrity. I have
been in the electronics assembly/calibration field for many
years and never have I seen such a thing. You've got to
wonder, two different brands, two different dealers and the
same problem. Buying a new product and having to work the
bugs out of it is nonsense! Maybe the design is well planned
but the finished product is junk! 73's to all

Richard,
Take your pick from below. At one time or another they're
all true.
1. Ego trip.
2. Propagation.
3. Don't know what they are doing (bleed over).
4. Don't care what they are doing (of course
it's YOUR receiver at fault, not them).
5. "All knobs to the right" syndrome.
6. Hasen't a clue as to how to stop it.
7. Too 'smart' to read the manual/book. (probably can't)
8. 'Broadcaster', never listens to the receiver anyway.
9. Deprived childhood.

'Doc

-------clipped--------

I think you may not be on the same 'page' as the rest of us.
You might take a look at the reference. You'll see the discussion
is about power. Run it through all the permutaions you like, they're
still talking about power.

open up radio fine the light,fine the wires that connect to the board
or where they connect too see if it has a cold solder joint sometimes a
cold solder joint will make it have a poor connection sometimes you
will fine this in older radio or even new radio as well. if it is a led
light, which is a diods it will have a resistor in line with it
sometimes they lose there connection because of heat the a resistor has
very few times you will see but it's happen. if it is a cold solder
joint just resolder it but be carefull not to cause a solder bridge !!!!

there are very few "true" quad antennas made for the cb band... I would stick with your 5 element you would need to double the amount of elements you have now to get a 3 db gain from what you already have. Is it worth the added cost and labor to put up a 6 element and have no appreciable gain in your signal. unless you want an antenna that has vert/horz polarity. If you went with a true quad it still would only be one(vertical) - (horz) or the other you would not be able to switch between the 2.

Bill if the motor maul is built correctly it will work very well without voltage sag for long periods of time. Not trying to argue, I just know this because I have one that I have ran into the ground and it works flawlessly.

>'standard' relationships;
> rms = 0.707 x peak or peak = 1.414 x rms
> avg = 0.636 x peak or peak = 1.57 x rms
> peak = 0.5 x pep

The above is wrong It should read:

When dealing with power of a simple sine wave, here are the
standard relationships;
avg. power = rms power
rms power = peak power
peak power = pep power

When dealing with power of a 100% mod.A.M. signal, here are the
standard relationships;

avg. power = rms power
rms power = 0.375 peak power
peak power = pep power

Hi Al,
Yep, that's right. It's easy to mod the 02a for 26.815 to 28.045 Mhz, but to go higher into the 10 meter band
I would need to change the second IF crystal. I can modify the Digi-Scan UFO to scan from 20.000 to 29.995 Mhz
and bypass the 02a. I'll tune the DAK for 28.725 Mhz and use it as a 10M QRP rig. I don't believe I need to
broadband because I'm only interested in 28.300 to 29.000 Mhz USB. If I'm wrong, I'll change it back.
Garry

I don't think so.

Going by your numbers 4 watts rms x 1.414 peak= 5.656 watts
What does 5.656 watts represent? Nothing. The math is wrong.

.636 avg has no meaning with power. .636 is just a mathematical
average that has no use with power.

"peak = 0 .5 pep " Wrong again. A peak voltage is half of a peak to
peak voltage but in no way means "peak = 0.5 pep" Instead peak
= pep

I don`t get it either. Here in upstate NY the average CBer runs an export radio, 100 or so watts and 200% modulation to talk across town. Always on AM! Many operators take pride in their ability to bleed both their neighbours and all of 11 meters. As we say here in the states, "go figure"... R.B.

If the pep is dependent upon the transmitter input, then what exactly are we dealing with if not measurable (no matter how we do it) variables of power?

2896. 10 watts from stock radio

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: Len <bk3562@yahoo.com>
Message-ID: <397518AF.3C983FF8@yahoo.com>
Source record: 44876

Did anyone ever see the output waveform modulated from a radio modified, maxed out to about 10 watts or so?? It is well distorted. Peaks are clipped starting to resemble a square wave. Tricking the meter into reading higher then it actually is. Hook up an oscilloscope sometime and check it out. If I peak out a radio, I tune it to the point of just distorting with 100% mod. Maybe hitting 7 watts depending on the radio. Not much improvement. Better off to use a linear with 1 to 2 watts out of the radio and 100% Mod. But then again using a linear on 27mhz is illegal !!

2897. Re: 10 watts from stock radio

Newsgroup: rec.radio.cb

Source record: 44877

Agreed totally from your observation. 5 to 10 watts does not buy you much
of anything in propagation and certainly local talk. Distorted audio is
horrible to listen to and just means you paid some poor slob a lot of money
to make a good radio sound terrible. 100% mod is achievable because most
radios are limited to from 60 to 80% from memory and increasing your
modulation and staying within the 4 watts legal power makes a much better
sounding radio. If more power is what you want then find someone that can
redesign the finals and use a higher power final.

2898. Re: Ext. Speaker 8 ohm vs. 4 ohm ?

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: "Gary from Florence, Alabama" <alagk@yahoo.com>
Message-ID: <sn9t7lap1nk44@corp.supernews.com>
Source record: 44878

essentially you get into an impediance matching problem. a 4 ohm speaker will be more of a drain on your audio power transistors. You could find a 4 ohm resistor and place in series with the speaker (not parallel) and that should make the equivalent dc resistance equal to 8 ohm. But audio IS AC and impediance takes into account other things other than resistance but as far as power requirements it would not tax the transistors as much

>are we dealing with if not measurable (no matter how we do it) variables
>of power?

I'm not sure if I am following your train of thought, however when
speaking of the power measurements that are common in rec.cb
Measurements like peak power, pep power, rms power, and
average power, just keep one thing in mind.

Power is power is power is power.

Meaning all of these measurements are the same exact thing. They all
measure the "true power" of the circuit There is only ONE variable
that changes between these different power terms. And that is the time
period of measurement.

Average power which is also sometimes called rms power measures
the "true power" of the circuit over a time period of sufficient
length so as to include numerous cycles of the modulation envelope.
This measurement is a good representation of the whole.

Peak power which can also be defined as pep power shortens the
time period of measurement to one RF cycle that is chosen at a
modulation peak. Because this measurement is so short it is not
an accurate representation of the whole, but it still is a "true
power" measurement.

Confusion comes into play when people use voltage conversion
numbers to falsely convert power. They also confuse PEP with
peak to peak. They also think a average voltage reading has
something to do with power. All of this is wrong.

All power, pep, peak, rms and average can all use this simple
formula.

(Voltage rms) squared / Resistance = Power
Just choose the correct time period for measurement. That's all.

P.S. true power = real power = heating power = average power

The idea is that a portion of the strike would be diverted through the grounding rod. The antenna would no doubt be destroyed but by diverting some of the power... it may keep what the antenna is attached to (a house or structure) from bursting into flames.

I agree fully... peaking a stand-alone radio to get more performance is a
waste of time and sometimes does more harm than good.
If you must get out better... you will have no choice but to improve your
signal strength by means of an external amplifier or an antenna with higher
gain... or both.

Don't confuse them any more. Let me do it with this statement:

All power measurements like peak, pep, average and rms
can be represented by the same formula.
(voltage rms)squared/resistance = power

Now if they really do understand the different power terms then
they will understand how just one formula can be used for all four
power terms.

In my opinion, I would have to say that the 102" whip is the best mobile antenna sold. They are 1/4 wave long, handle lots of power, are broadband, and sell for under 10 bucks. You can't beat that. I would also use a good ball style mount and get it as close to the center of the vehicle as possible for good omni directional pattern. I used one on with a bumper mount on my car and talked to Japan with a 148GTL (barefoot). That's preformance.

They have some draw backs. When you are on the move, it leans back and the swr goes up. They are tall and hit things while driving as well as garage doors when parking.

I'm not saying that those coil loaded whips aren't any good. I am saying that
the 102" whip is the best bang for the buck.

If I had to compromise and use a shortened 1/4 wave antenna, I would get the biggest physical size antenna that limitations would allow for the installation.

Lots of business band radios use a 10k ohm resistor at the anttenna jack to bleed off static. 1/4 wave and 5/8 antennas tend to build up static and take out
the finals as the whip is not at ground potential. Most 1/2 wave antenna designs
have grounded whips.

The high value resistor is almost invisible to the 50ohm impedence of radios.

2911. Need help on Cobra 148GTL-DX !!

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: Hackrbum <hackrbum@gate.net>
Message-ID: <8l31tm$15ok$1@news.gate.net>
Source record: 44891

I have a Cobra 148GTL-DX which I bought about 5 years ago. The unit has six banks of 40 channels - A thur F. It also has AM/FM/USB/LSB/CW modes. I know that C bank is standard 40 channel CB. Those anyone have a Mhz listing for all 240 channels? Or know anyway I can find out how to get it?

Thanks

Hackrbum

No need to hit the books for this one.. and an exothermic weld should be used instead of clamps, and strap should be used instead of wire, but the antenna is destroyed. I thought you inferred the ground rod would somehow protect the antenna. No problem. Books are great, but I prefer the great debates here, in addition. The truth is usually found somewhere in the middle.

Hello Tnom: I haven't enjoyed the CB Newsgroup this much in a long time.

I enjoy a good debate, once and a while. I have learned many things here, just readin the mail.

I just don't have a lot of time to read all the Hoo Raw, being out back at the, home on the antenna range.

Hmmm,
If it truly IS as you say below, then why is it that when disaster strikes, power and communications fail, it is usually the Hams the authorities call upon to help? When smaller boats get into trouble at sea, why is is that HAMS are the ones who are often called upon to assist thru such services as the Maritime Mobile Service Net? Why does the Red Cross rely on HAMS to run most of their traffic in the event of floods, fires, hurricanes, and earthquakes? Why does the weather service rely upon SkyWarn to provide up to date eyewitness data on wind, rain intensity, damage, size of hail, etc? Again a service provided by HAMS! Why is it that the Military relies upon/ supports the Military Affiliate Radio System (MARS) to pass health and welfare, and personal messages between service people and stateside? True, cellphones have lessened the need somewhat, but MARS passes these messages for free. Again, a service provided by, yup, HAMS! Why is this so? Because Hams have proven from the beginning to be a valuable asset to the community, state, and Nation when the chips are down. They have taken the time to get TRAINED for this, and those who are in positions of authority in government KNOW this. That's why.

Tell me, while you are so busy bashing hams, why the authorities NEVER call on CBers on any sort of blanket basis in a disaster? Why isn't there a CB MARS, A CB SkyWarn, a CB Races (except to see who can out-power the other), a CB Maritime Mobile Net? Yeah, you got that REACT stuff, but what do they "react" to? A broken down car on the freeway? I've never heard of or seen any of that REACT stuff at any of the dis-asters I've responded to--such as Hurricane Floyd in eastern NC. Nothing interesting to talk about? HA! I've heard technical conversations on the ham bands that would baffle many a layman--includ-ing YOU, I betcha.

No flames intended towards the majority of the nice people on the board, I'm just responding to someone who apparently is badly misinformed! And I don't care if the original poster was or was not a ham, either!

Use this jpg for further clarification. It is from the Bird website.
It basically puts all the confusion to rest once you learn how
to read it.

Sounds like a bad coax connector or bad cable.

Also, no one has mentioned that if it is mounted low on a side window on your motorhome, it has too much metal in proximity to it. It should be mounted high as you can get it so the whip clears the top of the cab. That could make the reflected power unusually high.

10-4 on the nice ground plane. I'd go with a Wilson 1000 centered on
the roof, a full size whip might work a little better but won't live
long if you have 12' overpasses and low tree limbs in your area.

The receive wire on a mic enables the receiver when the mic is plugged in.
It switches that wire for the transmit wire when the push to talk is pushed
down.

You sir need to reread the post before you open your mouth, what bill said
was very true, the TIP120 transistor and some of the others used in the
keying circiut of the amps he mentioned will cause a bad input match on the
input side of the amp.

2932. Mobile antenna for minivan

Newsgroup: rec.radio.cb
Date: 2000-07-18 00:00:00 UTC
From: DeckerDog <cherrybarbNOchSPAM@hotmail.com.invalid>
Message-ID: <02248749.4016c21d@usw-ex0103-019.remarq.com>
Source record: 44912

What would be the best ~36" antenna for a minivan ?
A mag mount like the Little Wil front and center on
the roof or something like the FireFly or Firestik II
mounted on the rain gutter ?

Another mounting option I would consider is a Wilson 500
mounted on the hood. This would give me the option of
putting it on the roof for some trips.

Our typical use is on long camping trips. Mostly just
receiving.

TIA

Dave

You should have never had to look inside
either one.

> You've got to
> wonder, two different brands, two different dealers and the
> same problem.

Two different dealers that do business the
same way. That's a coincidence, but nothing
to really wonder about.

> Buying a new product and having to work the
> bugs out of it is nonsense!

I agree. The end user who pays retail
shouldn't have to do anything but enjoy
his purchase. Something to consider is
that you probably didn't buy from a true
retail outlet in either case. For example,
I'm a true retail amp dealer. A Texas
Star 500 from me costs $370. The customer
sits with me and watches as I match his
radio to the amp and run the radio/amp
combo through its paces on the bench.
I answer any and all questions before,
during, and after the sale, offer
refreshments during the experience, and
do my best to make the experience pleasant.
That's retail. Swap meets, over the radio--
then meet in a parking lot deals, and cut-
throat mail order transactions; those are
not retail experiences.

> Maybe the design is well planned
> but the finished product is junk!

I disagree. The vast majority of Texas Stars
and Dave Mades work right off the bat and are
reliable. I understand that you had a bad
experience, but I'm here to tell you that what
you went through is not the norm--even when you
choose not to go full retail.

To tell you the truth, I'm not completely sure just
exactly what a "dead motor maul" is or does. You
may want to bring me up to speed on that (via e-mail
if you wish).

Until I'm convinced otherwise, I stand by my statement.

Your antenna is a conductor. If it is struck by lightning (or touched by a live power line) it will conduct this electricity into your home. In the event of a lightning strike by grounding the antenna it helps protect the equipment in your shack, since it takes the path of least resistance, the shortest ,straightest low impedance ground strap/wire should be used... You should eliminate the possible paths for lightning strikes. By grounding your antenna it bleeds off static build up , which will eliminate possible paths for lightning to strike. The best protection from lightning is to disconnect the antenna from equipment and disconnect the equipment from power lines. . By providing a path to ground ahead of the radio equipment the gear can be protected from the large currents impressed upon the antenna system by lightning Do you still think a ground rod at the antenna is for rfi? did i say it would save the antenna ? No grounding the tower,mast antenna etc is for lightning protection only... Go hit the books twistedhed...

yes g seven it is a full wave and also dual polarity , front to back
rejection is not as good as a yagi but the side rejection is great , and the
recieve is very good also, locals(20 miles away) that gave me a 2 before now
give me a 8-9 ! but as far as DX goes a quad is nice because it catches
both vert. and horz. check out signal engineering's web site also look
up the ultimate 11 meter antenna site for some good info on the subject.
good luck and good DX 138 rhode island.

Source record: 44925

Yep, I too totally agree that peaking out a stock CB radio's power output from
its factory set 4 watts to its max of about 8 watts ruins the audio modulation
performance of the radio. When you turn up the power output, the modulator
driver simply cannot fully modulate the carrier fully to 100%. I think the
designers of these CB radios knew that and limited the drive capability
of the modulators in the radios. If you stay at 4 watts or so, then the
modulator
is capable of fully modulating the RF final carrier envelope 100%.

The best and most useful tweak is opening up the mic gain limiter on the radio.
That will allow the mic amp to operate full tilt to modulate the carrier.
But beware that you can overmodulate the carrier when this is done too.
So you should know how to set the mic gain controls on the radio and/or the
power mics to get loud but clean undistorted audio.
On some radios the mic gain and modulators still cannot modulate the carrier
100%, and turning up the power mic gain on these to try to go any louder simply
will overload the mic gain preamp stage causing it to go into "clipping".
That is where you would also see "square waved" modulation output waveforms
on the RF carrier output if you hook up an oscilloscope to the RF output.

So in short, alot of you have to know what you are doing to get the best out of
your stock radios. Simply turning everything up is NOT the answer to getting
a loud clean sounding radio. Setting everything just right will!

And improving your antenna situation is the number one best contributor
to improved range and distance. Using an amp helps too, but then that is
illegal.

Unit 824, Audioman, back out!

2949. coax length?

Newsgroup: rec.radio.cb
Date: 2000-07-19 00:00:00 UTC
From: nomad101@earthlink.net
Message-ID: <39752845.92470255@news.earthlink.net>
Source record: 44929

Ok, heres a question for some one out there. I am putting a couple of 102" stainless steel whips on my two quads. Does the coax have to be a specific length for the whip in order to have a reasonable swr reading, (the radio will be approx. 3.5 ft. from antenna) and if so,,,1. how long should it be? 2. how small of a loop can be made without raising the swr? (if over 5 ft. it will have to be looped from front to back and so on.)
Thanks in advance for any help you can provide.
Gary

I have the following for sale:

-Uniden PC66XL--Clean radio in excellent shape..has stock mike, power cord, and mount..radio works good..is a loud talker I have been told..$45.00+ Shipping

-Uniden 122XL--Clean radio..few scratches..has stock mike and power cord..AM and SSB work good..stock audio..$55.00+ Shipping

-Cobra 21LTD-- Clean radio....has stock mike and power cord..radio works fine..the meter does not work..easy fix..$35.00+ Shipping

-Cobra 25LTDWX--Clean radio in excellent shape..has stock mike, power cord, and the mount..Radio has super mod..has good audio..$60.00+ Shipping

----------If interested E-MAIL me and I will respond ASAP----------

2951. Equipment for sale

Let me know if you see something you like or have any questions.

Connex 4800DXL. Excellent condition. Bought in July of 99 from Coaxkid.com. Has a few marks from a mobile bracket on the sides of the radio, and a talkback switch is on the left side by the mic connector. There is a connex duel control echo board installed and the knob is where the SWR calibrate was. Radio keys 2.5 and swings 45. LOUD on AM and crystal clear on SSB. I had the notch removed on the "course" clarifier and aligned it to 12 o'clock that way you don't have to "ride the notch". Radio comes with a Astatic 636L mic. I'm asking $175, shipping included in the US.

Texas Star Mod V plus. Great driver or small AM amp. Only a couple months old. Total key time maybe 10 minuets. Looks and talks like new. I'm asking 80 bucks shipped in the US.

President Lincoln/2510. 455 final. Radio was bought during the later part of 99. Very little talk time, maybe 1 hour. No mods other than the conversion and unlocked RIT. No marks or scratches on radio. Radio is like new and comes with box, all paper work and accessories. I'm asking 210 shipped in the US.

All work on this equipment was done professionally by Jerry's Electronics in Houston TX.

I should have some pics available soon.
thanks,
David Proske, SE Texas

I'm not sure what you mean by putting a couple of whips in your
quads, so, this may be totally out in left field. If your feeding
them singlely, and the radio is 3.5 feet away from the whip, I'd use
enough coax to reach from the radio to the antenna. Maybe a bit more
to make it easy to route it, but any more than that is wasted. (Boy,
is there going to be an argument about that!)

Rosco wrote:
>
> Wouldn't he see better results if he could get the antenna to a 1.1:1 match?

Probably, but the amp design is the main reason for
what he's seeing. The Black Face (with vertical
transformers) 400s (Palomar, Palomar Elite, Boomer,
Boomer Deluxe, etc.) are particularly unstable.
Fortunately, he's driving it with a regular CB radio.
If he was driving it with a high-power (also high
gain and somewhat unstable) export or 10 meter rig,
he'd be lucky if it worked at all (without squealing
or failing to unkey).

No.

The problem you may run into is not enough
metal around the antenna mount to provide
an adequate ground plane (aka image antenna
or RF ground). Here's the deal: the 102"
whip (don't forget the spring unless you
do all your talking on channels above Ch.
40) is only half of the antenna. For it
to work right (have a low SWR) the coax
shield has to connect to a large mass of
metal within a few inches where the antenna
is mounted. With quads, there may not be
enough metal mass to provide an adequate
ground plane. There are things that can
be done to deal with that problem, but
before you go there you should try a
regular installation and see what the SWR
is. Here's a tip: use mounts with SO-239
connectors and measure the SWR at the mount
if possible. Doing it that way takes the
coax completely out of the picture.

You are wrong amigo

The quad has the same amount of gain as the yagi with an additional element over the quad.

That is why they work so well... That, and they are a "grounded" antenna.. They are much quieter on RX.

TollHolio

You bought a high-end amp--don't use a mag-mount.
A Wilson 5000 is okay--but drill the hole, do the
sanding, and make sure the coax shield hooks up
nicely to the sanded area (provide an adequate RF
ground). The hole should be where you used the
mag-mount (the middle of the highest part of the
vehicle).

Otherwise, I don't have any problems with your plan.

If you're super picky, you should use resonant coax
lengths and have the radio (transmitter) matched to
the amp.

Something I forgot to include in my last post
is that you should do something to guard against
a fire if the hot side wire were to short to the
vehicle body. My personal favorite is a big relay.
Others will post their favorites. If you want
details about my ideas, e-mail me.

Dealing with that is just a matter
of telling me you want to use it on
SSB. Then it gets the killer #12
bias circuit and a switchable delay.

That's a good amp.

> Also what's the difference
> between the MRF 454 and 455?

There are two differences. The 454 has a one-half
inch flange and is rated at 80 watts. The 455 has
a 3/8" flange and is rated at 60 watts.

2978. Re: High Power AM Stations - I don't get it ??

Newsgroup: rec.radio.cb
Date: 2000-07-19 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <39767EF2.AD55D5F4@island.net>
Source record: 44958

An AM signal in CB is comprised three elements... A Carrier, upper side band and a lower side band all totaling 4 watts on the finals. On side band mode the carrier is removed (4 watts) and one side band (4 Watts)leaving one side band.

So lets say you switch to LSB mode (4 watts)... you lose the USB and carrier for a total of 8 watts, because the signal detail is now reduced by 2/3rds, taking 2/3rds less RF bands width. So you get 8 watts from the lost 2/3rds plus the 4 watts on LSB for a total of 12 watts. This is the basis of a simple legal CB radio signal.
Cheers,
John

Bill there was I reason I had to look inside both those amplifiers. Like I said, becuase of the poor workman ship, everytime I would drive over even the smallest bump parts of the circuit would open up and my SWR would hit the roof! Knowing that there was no problem with my rig or antenna I proceded to inspect the amplifier. I'll say if again there were numerous cold solder joints and the coax coax shield feeding the SO-239 was barely holding! It took alot of time to "work out the bugs" With the DaveMade I purchased over the weekend the initial problem was the power L.E.D. was not operating. I thought maybe if was open or burnt out. As suspected the anode side of the L.E.D. was barely soldered and was not making contact. Then I found the other overlooked solder point which was a resistor that was just poking through(never soldered) the power adjust pot. This is the reason I had to troubleshoot and "look inside" this one as well. I can't say if ExportsRUs is a true dealer but that was the same price I had paid for the Texas. Bill I thank you for all your input. It sounds like you take the time to put your units through "run in" before shipped out. Maybe we can do business sometime. Where is your place of business located? Do you have a web site? Maybe I can give these products a third chance. 73's

That's funny. That's the opposite of what I've known. For a 100% 4 watt carrier there is 1 watt in each of the sidebands.

Nice try but, it takes 50 watts audio to modulate a 100 watt carrier to 100%.
All the audio power goes into the sidebands, so you have a 100 watt carrier and
50 watts divided between two sidebands, or 25 watts in each sideband.

3000. Re: 10 watts from stock radio

Newsgroup: rec.radio.cb
Date: 2000-07-19 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <RBid5.1408$Yy3.60657@newsread2.prod.itd.earthlink.net>
Source record: 45064

Years ago, at the 'changeover' to 40 channels, I picked up a TRC-152. This was the PLL version of the Radio Shack TRC-52. It was never in a catalog. It was followed almost immediately by the TRC-452 which was IDENTICAL to the TRC-152 EXCEPT for the power connector area (which had chokes for RF supression on the 40 channel version, as did all the speaker, pa, and mic jacks) and the dial indicator, which was 40 channel vs 23. In fact, the rig was quite easily convertable to 40 channel. (Not that "I" would ever do such a thing....)

Anyway, there were all these rumors about how the 40 channels would have only 50% modulation, and 2W of power floating around. So I got a scope and set it up with the rig.

It would easily pump out over 4W of power, at 100% modulation, when adjusted properly. But when I did the 'trapazoid' test, it didn't look that great. It would 'peak', but it wasn't 'loud' kind of thing. So I started tinkering. I ended up turning the rig down to about 3.2W, cranking the limiter back to match, and tweaking up the gain on the audio. The end result was I had a rig that was incredibly clean, and just 'blasted away' on the air with an incredible ammount of punch. The trapazoid showed a pretty full pattern!

Well, one guy wanted my radio, and I coveted the TRC-449 SSB unit which had just come out. I was going to buy the 449 anyway, then this guy just 'wanted' my 152. I offered to sell him a 452 that I'd set up the same way, but he just wouldn't have that. He wanted "MY" radio, not one set up the same way. It HAD to be the radio he had heard on the air. I was kind of leery about selling a radio that was 'converted' but he insisted, and when he offered me the retail price of a new 452 ($140) well, I sold it.

The difference of 3.2W ot 4W, or even doubling the power to the 8W range you're not going to really see a practical difference in performance. But you WILL perceive the benefit of having the radio adjusted 'clean' and to the best performance with regard to modulation.

I head these people on the air who have the rigs adjusted 'wide open' so they splatter all over the place. Just remember, there's only so much power available, and any that goes into generating splatter is wasted, it's NOT on track with the signal you WANT to send out, it's actually taking AWAY from your signal. I guess this is a prime example of a little knowledge is dangerous. Damn little!!

Jerry,

Kind of reactionary aren't you?

Well, first off, while what you say is GENERALLY true with regards
to the raw facts, it reminds me of the old story....

The first mate came back from shore leave and found an entry
in the log for the previous day. "The first mate was drunk
today".

He confronted the captain, who said "It's true, isn't it?"

Well, the captain found an entry in the log the next day from
the
first mate. "The captain was sober today".

And while I said your facts were 'generally' true, it's not 100%.

CBers ARE involved in Skywarn and RACES in some parts of
the country. Quite the opposite of what you try to show. There
ARE HAM groups who welcome CBers as another aspect of
emergency service. HAM groups who, in my opinion, AREN'T
so insecure in themselves that they have to generate artificial
distinctions and berate CBers just for being CBers. Besides,
association is the best recruiting ground.

Technical discussions on the HAM bands? Big "F'n" deal!! I've
also heard an extra class HAM 'just discover' that alkaline
batteries last longer than NiCads! I've heard an ARRL technical
representative (an extra) actually tell someone to cut the 'lock'
line on his rig to expand coverage. On the other hand, I've heard
a discussion on CB of how to modify a Motorola PLL circuit
that uses the a dual-modulus prescaler that I'll bet not 1 out of
10,000 HAMs could understand.

And this....

> Nothing interesting to talk about? HA! I've heard technical
> conversations on the ham bands that would baffle many a
layman--includ-
> ing YOU, I betcha.

Well, that offends me. You come off with that statement as a
little self-important prick. Sorry for being so explicit. But unless

you show me a list of patents that give you such a right to be
'brain proud', my assessment stands.

Don't feel so superior over a 'technical' discussion that you've
heard on HAM. Can YOU do as good? If not, then put yourself in
your own clasification of CBer!

Sure, theres some real idiot CBers, and as a general rule, they
are the loudest and most pominant at times. But then again,
there's some real asshole HAMs as well. Don't think for a
second that ANY one group has a monopoly on the idiots out
there.

>hard..Anywho, what town in CT are you in ?? E.Windsor here..Gonna go run

Im in "Hat City" (Danbury) CT. And to answer your question.....The D201 came in (2) versions, A hand wire version, which was the first and rarest.......and 2 years later was fitted with "circut board" plug in modules (just like the D201A) its 40 channel counterpart. If you had the hand wired one, AND if it was in mint cond.....its worth about 800.00 dollars, for that matter, the D201A in "like new" condition, with all manuals, and mic, is likewise worth that amount. E-Bay just sold a like new. D201A and it sold for $810.00. Have a good day, regards, Frank in CT.

>>are they one is the same ?
>>
>

They are related but not the same. SWR also depends on how much forward power you have. The more forward power then the more reflected power it takes to give a high SWR. Usually a Good SWR means that reflected power is about 1% of the forward. This equates to an SWR of about 1.5:1 or less.

The difference from 4W to 8W is 3db. "S" meters are by definition
6db per "S" unit. So to REALLY see a 2S change would require
12db, or 4W to 64W. From 4W to 8W would really be 1/2 S unit.

What you actually are seeing is the fact that most radios do NOT have
a calibrated S-meter. They have a received signal strength meter
that does what the manufacturer built it to do. In reality, what 99%
of the manufacturers do is just tie the meter anywhere they can in the
receive IF. So a stronger signal does get indicated by a higher meter
reading, but they really aren't accurate, or even close to it.

In addition, most radios will have some AGC circuit that amplifies
weaker signals more than strong signals, and it's usually controlled
in the IF. With AM or SSB you don't want the IF to go into limiting.
(You do with FM.) The end result of this all is that the stronger the
signal, through this non-linear IF strip, will have higher audio at
detection.

BUT, applying a signal to an RF waveform and looking for a 'peak'
reading is not the whole story. Did you ever hear someone who
sounds weak, like they are talking 2 feet from the mic? Well, imagine
that you turn up their mic gain so that they are as loud as everybody
else. Would they sound as good? Not hardly, there would be no
'fullness' to their sound. Mics are non-linear as well, a property
called
'proximity effect'. In mics, it usually affects the bass frequencies
more
than anything else, and bass is where the most energy is in a voice.
So audio tailoring could help here, as the bass doesn't always give
the best 'readibilty'. But bass sure will add audio 'power' to the
signal,
right? Want to waste all that power there? Of course not, that's my
communication mics don't generally work that well as recording mics.
(And yes I do know that some people use recording mics for
communications.) But think about your telephone, think that's really
hi-fidelity? But you can understand what someone is saying even
when the line falls to pieces with noise and interference, right.

Back to the audio itself. The 'limiter' in a CB set really is no such
thing.
People who don't know squat think it 'limits' their power. In reality,
what a PROPERLY designed and adjusted limiter does is set the
peak limit for the audio BEFORE it goes to the RF. Properly adjusted,
this actually lets you TURN UP the audio gain to boost the MOST of
the signal, and at the same time 'limiting' the peaks so that you

'chop off' the tops. The end result is a MUCH more powerful audio signal. NOW it can be sent to the RF stages, and there it can be put with the RF properly without carrier cutoff.

AM sets generally have an audio output transformer that is in SERIES with the 12v. The 12v come 'through' the transformer and now becomes 12v with audio riding on it. This is then sent to the finals of the RF stage as the power supply. If you drive the audio peaks too hard, you are actually TURNING OFF the finals for a fraction of a second on those peaks. This means less power, during those 'turnoffs'. AND it also means the 'splatter' as the carrier goes on and off. You don't get something for nothing, so the energy that is in the splater comes from where? You guessed it, right where you really want it. So taking out the limiter hurts you, big time.

Now, the best situation would be if you could drive your finals as hard as possible to get the most dead carrier power out. Then drive the audio as hard as possible but JUST BEFORE cutoff. AND drive the audio with the 'fullest' signal. Just like having a bassdrum on an audio track. Lots of power during the thud, but nothing the rest of the time, right? But if you had a 'full' audio track, isn't the stereo amp pumping out more power? That's what you want with you CB audio as well. The 'fullest' signal possible.

One final item. SSB sets are a bit different. You can't feed the audio
to the finals like the way I described above with SSB. SSB sets by design generally will mix and filter the signals at a low level to generate
the SSB signal, then have a linear output stage to raise them to the actual output design power. (Yes, all SSB sets have a 'built in linear'.)
I'd have to look, but I wouldn't be surprised if your CB set did the same
thing for AM. It would actually be a simpler design. In that case, if you
are boosting the power by controlling the finals, you aren't doing the same thing an AM set would be doing by boosting the RF and not the audio. All you did was basically change the 'level' that appeared at the output antenna jack.

Mike

Not quite true. The fidelity of the SSB signal is the same as the AM
signal. The difference is that tuning on a SSB signal is critical, it is
not on AM.

Your right, a top loaded antenna would work 'better'
mounted anywhere on the van. The only 'problem with top
loaded antennas is that mechanically, they can be a 'pain',
and really, when you get down to the 'nut-cracking', there
probably isn't enough difference in received signal between
a top loaded antenna and any other comparable one.

Source record: 45083

I agree about the fidelity of AM over SSB, but for voice communications it's not really a big deal.

If this is the case, then why do these guys that run high power AM stations also quite often have their echo boxes turned up to the max making what they say almost unintelligible ?

Best regards,

Richard.

RadioFreak wrote:
>
> Bill there was I reason I had to look inside both those
> amplifiers. Like I said, becuase of the poor workman ship,

I completely and totally understand.
I got it the first time.
I'm sorry you had a bad experience.
The brand choices you made were
good ones. The fact that you received
two duds in a row is a legitimate knock
against our little esoteric, underground
industry. There are serveral sets of
hands a completed amp goes through
between the manufacturer and the end
user. In your two cases, none of those
sets of hands chose to perform a complete
inspection. It proves that complacency
(a lack of true interest and caring) and/
or greed (taking/shipping more orders
supercedes making sure the units work/
customer service) exist in this industry.

> I can't say if ExportsRUs is a
> true dealer but that was the same price I had paid for the
> Texas.

Exports R Us is a discount mail-order
outfit. The true retail experience
involves personal interaction. Mail-
order is used to get a better than
retail price and/or obtain something
you couldn't obtain locally. The
Exports R Us price on a Texas Star 500
is $40 less than mine.

Steve (the man at Export's R Us) tells
me that he has employees that test every
unit prior to to shipping. I believe
him, partly because he seems like a
straight shooter, and partly because one
of the transactions between he and I
involved my selling him a spare B&K 1040
CB test set as partial payment for an
X-Force amp. It's too bad yours got past

his testers unchecked. Hopefully Steve
will see this and act accordingly. My
experiences with Steve have been good.
I've bought two X-Force amps from Steve,
and they both worked right from the start.
I inspected them, tested them, and counseled
the end users on proper installation and
operation. The newest one has been in daily-
use service for over 6 months. The older
one has been in daily-use service for close
to a year. Neither has been back for repair,
and both customers are satisfied with both
the amp itself and the choice of brand and
model that I helped them to make. That's
how this type of transaction should go (and
usually does go).

> Bill I thank you for all your input.

You're welcome.

> It sounds
> like you take the time to put your units through "run
> in" before shipped out.

I trully enjoy what I do. I have a genuine
interest in CB amps. That means the time I
spend with them is a joy rather than a burden.

> Maybe we can do business sometime.

That's up to you. I don't do much mail-order
business. Firstly, because it's not a true
retail experience. And secondly, because I
don't like being on pins and needles waiting
for the customer to receive and test the unit.
I don't feel right until the customer contacts
me and tells me the unit arrived undamaged and
works to his satisfaction.

> Where is your place of business located?

25 miles south of San Francisco.

> Do you have a web
> site?

Yes, but it has nothing to do with the sale of
CB amplifiers.

> Maybe I can give these products a third chance.

Your experience with Steve should have
been satisfactory. It's too bad it wasn't.

I can work with you if you'd like. There
is another choice in 4 device amps that I
think you'd like. The build quality is as
good as it gets in this industry. The design
is very good too. The amp is fully featured,
has output filtering (a tuned output circuit)
and a fully regulated and adjustable bias
circuit for each pair of transistors. It's
not as powerful as a Texas Star 500, but it's
more stable, and very nicely built. I have
a digital camera and can send you pictures
if you'd like. If you want to move forward
with this, contact me via e-mail.

I don't care how much tuning it simply won't sound the same! When you find an SSB station with broadcast quality audio you let me know! I think you will be searching for a long while..... Have talked to folks on $5000.00 + high tech sideband radios, and they didn't sound as good as a few hundred dollar Ranger transmitter with a D-104!

its got to do with the selectivity of the receiver.
ssb uses narrower filter bandwidths than am.
if you have access to a high end shortwave receiver listen and change the bandwidths on both am and sideband.
ssb can sound very good. the whole idea about ssb is to take up less space and cram more stations in a given frequency range, hence the narrower filters.

> SWR also depends on how much forward power you have.

Well not quite true, the swr is the same no matter what the forward power level. It doesn't matter if the forward power is 1,000 watts or .1 watt, the swr is the same. However at .1 watt the loss in the coax may be enough that the reflected power is attenuated to the point that the swr meter cannot read it or the swr meter may not be very sensitive at those low levels.
And speaking of coax loss, one way to check a length of coax (long lengths) for loss is to short the antenna end which should give a high swr reading. Bring up just enough power to measurer the swr and if the swr is low, then the coax is lossy as the reflected power is being attenuated due to the losses and giving a low reading (or you have a really long piece of coax). A high reading would indicate little loss in the coax. I used to have a chart that told what the db loss was for a particular swr reading, maybe I can find it.

> The more forward power then the more reflected power it takes to give
> a high SWR. Usually a Good SWR means that reflected power is about 1% of the
> forward. This equates to an SWR of about 1.5:1 or less.

It wouldn't be interesting at all.

He's just another guy with a novel
(for now) schtick. In person he's
nothing special. You know how it works.
At first you like the guy's wit and
originality. You make an effort to
meet him. He turns out to be just
another guy (maybe even a loser).
Then the guy's act loses its luster
(and maybe even becomes annoying).
After awhile, if the guy keeps up
the same old act, you begin to hate
him. If it keeps up long enough you
find yourself lashing out against him.

In my 20 years in this hobby I've
seen that cycle over and over. I've
been part of it a few times.

Message-ID: <20000719180447.14004.00000047@ng-fg1.news.cs.com>
Source record: 45106

Hello Group,

I have a 2000 Ford F150, and I was wondering if any one could offer some suggestions about installing a one driving four Davemade linear (400-800 watts) in a vehicle this new. The alternator is a 115 amp and the battery is a 72 amp hour. The antenna I thought about using is a Wilson 5000 magnet mount. I was going to run four gauge welding cable direct to the battery.If anyone could offer any suggestions or insight it would be appreciated.

Thanks,
Dwayne

Message-ID: <l1qd5.243$io6.9415@news2.voicenet.com>
Source record: 45109

hamm4fun , your post is very contradictory .. The ratio of the maximum current to the minimum current is the same as the vswr, so either current or voltage can be measured to determine the standing wave ratio. the ratio of the reflected voltage at a given point on a line to the incident voltage is called voltage reflection coeffiecient. you can also express the reflection coeffiecient in terms of forward and reflected power. quantities that can be measured with a directional(bird type) wattmeter.

So to answer it in simple terms... "can you have a low swr and a high reflected power ?
or visa-versa" No they are a ratio of each other.... ?
"

"Hamm4fun" <hamm4fun@aol.com> wrote in message > >
>
> They are related but not the same. SWR also depends on how much forward power
> you have. The more forward power then the more reflected power it takes to give
> a high SWR. Usually a Good SWR means that reflected power is about 1% of the
> forward. This equates to an SWR of about 1.5:1 or less.

You are probably correct Dave is an intelligent man, although they can be used for competition. like I said, if designed properly you will not lose any voltage supplied to an amp.

And THAT IS EXACTLY WHY THERE IS A PROBLEM!!!! It's like the story of the alcoholic who drives home everyday from the bar drunk for 20 years, and never gets in to an accident, or even a drunk driving ticket. The drunk could rightly claim FROM HIS OWN EXPERIENCE there is no problem with drinking and driving. The more informed among us know better from bitter experience what harm a drunk, or momentarily distracted driver, can do on the road. So Aaron all you can really claim is you have been lucky so far by not becoming the cause of an accident and or killing somebody. It is a sad fact there are far too many people like you who believe there is no problem, until the truly unfortunate occurs. That's why these laws are being pushed on the public to control people like you who don't know better.

Paul I know what SSB is, I know its capabilities, I know its narrower
than AM, you haven't stated anything new! Yes ssb can sound GOOD! All
i've stated is I've yet to hear a "Studio quality" SSB station..... And
very much doubt it will happen.... And that I PERSONALLY PREFER The
fidelity offered in good old AM..... Yes I do talk on SSB.....

Yeah, that`s the way to do it. I recommend fusing your power line at or near your battery, you`ll be protected against short circuits caused by abrasion. R.B.

: drive the drivers. Understand?
: Miles Davis

Understand that I've never, ever heard anyone able to run a driver properly on the cb band. You always get greedy or don't know what the hell your doing and it just hoses up the band while your on. If you live in a city, everyones personal electronics suffer for your cheap thrill.

You tell me your setup and how your run it, I'll tell you what your doing wrong and how some practical changes would clean it up. It's the least we can do when your in denial about the quality of your signal.

cheers
skipp

>I drive my 4CX5000 with a Kenwood TS440SAT. Nets about 12 Kw output.

That's calling it close... I've never been able to pull off that type of
output from a TS-440 exciter. I'd be willing to say I don't believe it
unless I saw it myself. A picture of your Ip and Ep meters would prove it.

> So, yes, depending on the input swamping resistor on the grid, you can

I have never caused an accident in 42 years of driving. For 25 of those years I regularly used a commercial radio in the work vehicle - sometimes under stressful high speed city driving conditions, for 8 of those years I regularly used a commercial radio on the work motorcycle - yes that means riding one handed while talking, for most of those years I had a ham rig, both SSB and FM in the private car, and for many years I had a ham rig on my private motorcycle. In recent years my car mobile rig has been CW only. That driving record is not luck. If you can't handle operating a radio (or a phone) while driving then don't, but don't get big brother spoil it for those who can...

Mike,

I was responding to a post that implies that hams NEVER have anything interesting to talk about, with which I differ, and that ALL hams are guilty by association. There IS no monopoly on "smarts" in any group, nor can one judge a person's knowledge of any subject based upon his being a ham or not. That's what raised my ire.

There are "idiot" hams just as less than smart CBers. There are hams who got their licenses by merely memorizing the questions. Just like you, I have run into so-called "Extra" hams who have NO knowledge of theory whatsoever. That disappoints me. Case in point: I build a version of the popular "screwdriver" antenna as a hobby and sell them at hamfests and upon request. You'd think an Extra Class ham would more than know how to install and resonate ANY HF antenna. NOT! Several times, I had antennas to come back to me, the owner complaining that it "wouldn't" work. There was, in fact, nothing whatsoever wrong with the antennas. They just didn't know how to deal with it. They are "appliance ops", not technicians. I had one to come back, and the reason it wouldn't work was that he omitted the impedance matcher that was supposed to go at the base. He couldn't figure why it wouldn't work below 20 meters! Installed the matcher, VOILA! It worked fine. He asked me when he first arrived, "What's this little thingy?" LOL! Do I know everything about radio? NO! But I am learning--for 40 years I've been learning since I started listening to shortwave on Dad's old Philco. That's why ham radio is attractive to me: the learning, the experimenting, and the public service. Further, I will NEVER know it all.

But, in spite of the bashing of hams, it still offers me much more than CB. Yes, I use CB, too. But only low power, and legally. To equal the things ham radio offers, I'd have to be ILLEGAL on CB which puts me at risk, so I do my "heavy duty" stuff on the ham bands.

You stated (are you the original poster?)at least by implication, that hams are ALL assh$$$$ with attitudes and have nothing worthwhile to say. And that's when I pointed out that when the chips are down, the HAMS are the ones called upon as a general rule. I don't doubt that there are situations where CBers are able to help, but, again, it is the exception rather than the rule. Ham radio has merit as does CB, but when you post negatives about people, i.e., hams OR CBers, you can usually expect a thread to follow.

If your serial number starts with a 3 or less, there is a battery in it
that is dead. If you are not comfortable with opening up and disassembling
your radio, get a professional to do it. It is not a procedure for non
techies. You must take apart the front panel and solder in a new battery.

--------clipped--------

Depending on the length of the coax your testing, shorting the
'antenna'
end can give you the same reading as it being open. What do you do
then?

I can attest to that. I know one of the people
he mentions and I told him the exact same thing
about proper care & feeding of you're friend.
He talks on it constantly and never really sounds
bad. My only beef with those type of amps are
the sideband capabilities (None).
I personally enjoyed the DX667 or my Favorites
for the past 4 years have been the Messenger 1200,
1800. Day to day use they take a licking and keep
on ticking.

A competition 3CX3000 is nothing more than more B+ and more grid bias.

Anyone who pays more for a tube box in "competition model" format is a dolt.

Just get bigger power supplies and be done with it.

3084. Re: High Power AM Stations - I don't get it ??

Newsgroup: rec.radio.cb
Date: 2000-07-20 00:00:00 UTC
From: The Game <TheGame@yahoo.com>
Message-ID: <4Drd5.248$io6.9533@news2.voicenet.com>
Source record: 44964

In the real world of audio reproduction, we know that our hearing sensors response to sounds between 20 and 20,000 Hz. Typical daily sounds are usually between 70 and 14,000 Hz, and the full electronic reproduction of such can be termed "Hi Fidelity".

However In the world of Single Side Band transmissions the breath and depth of the audio fidelity leaves a lot to be desired because of the allocated narrow operating bandwidth we are confined to.
Instead of 20 Hz to 20K we only have usable audio frequencies between 100 and 3,000 Hz ,that is if you own a late model stock Kenwood product, the others, somewhere between 200-300 Hz on the low end and 2,400 to 2,700 Hz on the high end!! But they all can be corrected.

In order to fool one into thinking he hears full range audio while listening to an SSB broadcast we have to fool our hearing sensors by emphasizing certain portions of the low and high, allocated frequencies.

There are two audio frequency's that are paramount within the limited bandwidth we use!

100 Hz for the low-bass frequency's
3.1 kHz for the high frequency's

These are the most important and must be set into your pre audio system first.

Any other frequency should enhance the two primary frequency's, 100 Hz and 3.1 kHz.

Info taken from... http://www.kc4pe.com/ go there and read the rest This man sounds like a million buxs on ssb, i have heard him and his buddies on the air and they sound fantastic ..

When i turn my radio ON it allways comes on to 26Mhz, and sometimes it can not be controlled properly at all !
It seems to have an own will of somekind.
What might be wrong ?
It transmitts and receives ok.

Source record: 44968

WOW!!!

Someone out there still has a virgin FT101E after almost 25 years!

When the FT101 series radios left the factory, the 11m bandswitch tap for the tx driver stage was tied to ground to prevent transmission. Simply remove the bottom cover, then remove the steel plate that covers the bottom left side (under tube/bandswitch area), and look for a brown wire about 2-3" that connects from a bandswitch contact to a solder-stud on the chassis. If you look closely, you will see the switch's wiper (common) making contact with the correct terminal when you put the bandswitch in the 11M position. Some of the FT101's had the brown wire twisted in a loop to make it easier to pinpoint.

Good Luck,
Eric

There are alot of really decent power microphones out there and I
personally have not used all of them, so I cannot say for sure which
one is the best. But I do know of the ones that are sure shots and
very well just may be the best ones to use. I would like to
recommend the old Turner +2 base station microphone(s) as one of
the true Greats of all time. I just bought 3 of these suckers and cleaned
them up and fixed them up and they are kickin' ass.

I hae a D104 Silver Eagle base power mic too (about 13 years old)
and it can be decent tied to the right radio. But to me colors the
sound with a tinny voice sound. Not as much bass as the old Turner +2.

For Echo mics, I personally use the Sadelta EchoMaster Plus base station
mic and have gotten really good audio reports on it. I monitor my own
audio most of the time and I agree it is a decent sounding mic with echo
turned up just slightly.

I have a EC2018TB mobile echo mic and that seems to be pretty decent too.

I have a D104MB6 and that has the classic Astatic D104 tinny voice sound.

If you could find a used Turner +2 base station mic, I would pick that as my
first choice. The D104 Silver Eagle is also decent but I like the bass-ier
sound
of the classic Turner +2 better.

All the mics I've listed above however are excellent mics in their own right.
I recommend any one of them. I don't have any noise toys or speech processing
mics, so cannot comment on them.

824 Audioman, back out.

I have a Silver Streak 350 Amp for sale. It does 120w on low and 350 on high. It has a preamp and SSB mode. I have had the amp for about 2 years. I used it for about a year in my truck. It has a few light scratches on it. All controls work. I have my eye on a beautiful screwdriver antenna and need to sell the amp. I no longer use the amp, since I got a bigger one. The Silver Streak really talks. I am asking $225 on it. Please e-mail for info. Thanks.

3095. Re: lowest price's on the internet

Newsgroup: rec.radio.cb
Date: 2000-07-20 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <ylud5.2876$t%4.39591@typhoon.kc.rr.com>
Source record: 44975

I am NOT here to start any crap however here is my thoughts on the matter...First off I am alot more inclined to buy from a shop that has there prices marked up front. I like to compare ONLINE. I know that a fella can always email and ask but any REAL compay would go ahead and put the extra effort in and add the prices...I too can sell retail (I have a Federal ID number along with a Kansas State Tax number most of the time that is all that is required. Sometime you have to by a min amount but again for me that would be no biggie. HOWEVER since I DO not know how to repair radios I would NEVER retail radios and equipment....SO..all I would have to do is look in the wholesale cat. and then shoot you a price...I bet I can beat ALMOST everyone by at least a penny....I have NO overhead have to STOCK and no shop...but by golly an email address and a webpage and bino I R a radio dealer..... I AM NOT TRYING TO SHOW DISRESPECT to Wildcat Radio at all...but after all he did throw the first volley over the wall....

Again I will not buy from a person who does not post prices...tells me he is a backyard dealer...I DO support the Real live CB's shops on the web.....after all to them it is much much more than a hobby...lt is bread on the table!!!! Not just extra spending money...and if I pay 5 bucks extra big deal...I will know that he will still be there in a year or so...I have not done any dealings with hillbilly but ask him how long he has been selling AND working on not only CB's but other electronic stuff as well..also I am sure he can give horror stories on the "station wagon radio shops out there" .(Dave I am not trying to drag you in this but your shop was one of the first to come to mind)

You can say that I am full of BS and this is fine...however I can prove that I have spent damn near $2,000 with LEGIT CB radio dealers in the past 6 months...not including all of the private dealings that I have had....and no this is not bragging either...simply stating a fact!!!

BTW I did get burnt with antenna man...my own fool as fault...but neverless it did happen...Legal action is in the works...side's I aint never been to the State of LA...and it is only a 19 hour drive from Kansas City..a nice little road trip may be in the works....

See-ya

Peace

Well good for you. And tomorrow you can easily have your first. To barrow a saying, with some modification, from the investment folks, " Passed performance does not indicate future performance".

> That driving record is not luck.

I can point you to a traffic court judge who if you should ever appear before him will very much disagree with that point.

> If you can't handle operating a radio (or a phone) while driving then
> don't, but don't get big brother spoil it for those who can...

That really is a sad point Aaron, just like the drunk driver who has yet to have their first accident, is you THINK YOU CAN. There lies the root cause of the problem. Until the day you run over somebody's kid you don't think you are driving in an unsafe manner. That is why these laws are being passed because people like you are in denial. Since you can't, or don't want too, correct your behavior it now becomes society's problem, and the solution is to pass the laws that are now being proposed to protect society by correcting your behavior for you.

> That sounds just like what the gun control people say...

That is an issue for another news group.

Try listening around some of the Ham bands.... and the commercial Short-wave bands... lots'a great sounding SSB stations. WWCR (on short-wave), BROADCASTS in SSB, as does HCJB in Quito, Ecuador (and many more stations seem to be heading in that direction... they get a better signal to a larger audience more efficiently)... EXCELLENT audio fidelity... if you have a stable receiver capable of reproducing the audio.

How are the "grounded"? I have seen yagi antennas constructed using the
"plummer's delight" method, but no quads. The quad driven element has always
been insulated from the boom.

Any antenna run in horizontal polarization will be less noisy than one
used with vertical polarization.

A friend has a 2000 F150 4x4 x-cab with a 5 pill X-Force and Wilson 5k magmount. He grounded the amp chassis to vehicle chassis w/ 4ga, and ran hot and ground w/ 4ga straight to battery w/ 100a fuse. Sounds great, no problems.

Read again, that IS what I said. The only problem with quads is that the
benifit from extra elements peters out at 4 or 5 elements giving them a max
gain of about 11db. This is because they are a low Q antenna. As far as noise
any antenna that is a DC short will get rid of this kind of noise.

Nothing contradictory about it. I just stated that Reflected power did not equate to SWR.(thats what the guy asked) You have to know the forward power too to calculate SWR. A 1/2 watt of reflected power is not going to give the same SWR with 10 watts forward as it does 100. What is wrong with that?

Jerry,

I wan't the original poster. I was, and I admit it, a little
reactionary
to the posting you did. There's a nerve there. One aspect of it
is a local 'wheel' who badmouths CBers, and in the past
tech-no-codes, and then even a diatribe over anyone less than
extra who ever gets a call of someone he 'knew' when they
finally did a recycle of the calls. For all his badmouthing of
CBs, I KNOW he used to use them.

No, I wasn't bashing 'all' HAMs. Just a few very visible ones. And
just like the guy you dealt with on the antenna, it's the 'bad' ones
that are the most visible. I just had a bad experience with a
certain company. Things got screwed up, then again, and again,
and finally in desperation I ended up sending a long email to a
BUNCH of people there. Well, things got done! It was actually a
supplier problem, and more of a description that the supplier
supplied kind of thing. The end result was that I'm a satisfied
customer. And I told them that. In this case you're not always
remembered for how things are when they are good, but you
won't be forgotten for how things are when they are bad. So make
sure you're remembered for how you handle them!

Put a hundred HAMs somewhere, put 100 of ANY group somewhere,
and you'll have good and bad. Standouts in BOTH extremes. But
what will people remember and talk about? The idiots!!

Sorry if I came on a bit strong. I realize your post was also fueled by
the frustrations of dealing with some of the less than mentally superior
beings!

Hmm, you sell an antenna... I'm not familiar with the 'screwdriver'
antennas. I used to have a 10-80 trap vertical but with the
divorce... It 'disappeared' when I didn't get it out fast enough.
Oh well.... Now I just have one long wire and a 40M dipole fed
with 300 twinlead for my K2. I've been thinking of another vertical,
but not sure about it yet. I currently have all the parts to build the
double coil mobile antenna from the April QST on the bench. Just
picked up the fine-thread bolt and the 'whip' recently, so
construction can really begin!!! But I'd like to hear more about your
'screwdriver' antenna. (You can email me direct through the ARRL
reflector.)

well I would say the price seems right..... now if that guy
would drop the price of that amp to about 50.00 he would sell
it...

and by the way..... I've done business with bob several times
and he always treated me right....and fast service

No, but I have posted the URL's, in this news group, for reports done by those who are. I suggest that you read them. From your attitude I'm sure you will not be pleased with the conclusions, but facts are facts, and your comments do not change the data collected which supports my point of view. If you can provide the URL(s) of a document, or professionally, conducted study that refutes the conclusions drawn in the studies I referenced, then post them.

I know nobody will change your mine Aaron, just like the drunk who thinks he does not have a problem. You will go to your grave and never understand why these laws are being proposed. I am not going to continue wasting my time to explain it to you. The URL's for the studies supporting the view that mobile cell phone use is dangerous I have posted before for all in this news group to read, and respond too. If you disagree with the conclusions, that's your problem. And besides, at least I have the balls to identify who I really am, and I'm not afraid to take the heat for my views.

I have a Silver Streak 350 Amp for sale. It does 120w on low and 350 on
high. It has a preamp and SSB mode. I have had the amp for about 2
years. I
used it for about a year in my truck. It has a few light scratches on
it.
All controls work. I have my eye on a beautiful screwdriver antenna and
need
to sell the amp. I no longer use the amp, since I got a bigger one. The
Silver Streak really talks. I am asking $225 on it. Please e-mail for
info.
Thanks.

Hey wildcat, not once did I say anything bad about the products. "guys like me"? Seems you are guilty of the same stereotyping you accuse me of. That is called hypocrisy, my friend. Save the tales of woe. Everyone has their reasons for not posting prices. But get this, the public just don't care. If you make a claim, the burden of proof lies with you to show it, not the potential customer to go seek it out. Sorry, but the facts are I can call stores and shops all day long to ask a price, but I won't do it and neither will the majority of the public waste hours on the phone to find your price is only "comparable" or to save 1 or 2 dollars. Most people in the hobby have a fair idea of what gear should cost. Post your prices and let the public make the decision of who is truly lower. Hint: Shipping prices should show as well.

......Perhaps we should all go back to hoofin' it.... you might be right...
think of all the distractions in a vehicle.... MY GOD MAN.... the world's
just not safe as long we have cars that require you to manually shift
them.... you could have an accident while bangin' gears! ...or while tunin'
the stereo to your favorite oldies channel... god forbid you should maybe
want to change a CD or Cassette without pulling to the side of the road!
Maybe the feds should outlaw riders/passengers as well and make all cars
single seaters by edict.... heaven knows how many times I've been distracted
while driving by my passengers. Maybe we should sterilize anyone who
desires a driver's license... you know how much of a distraction youg 'uns
can be on a trip. While we're at it.... for those of the public so inept at
driving, we should remove all billboards, signs, and anything else worth
looking at along the roads.... we sure wouldn't want any one to be
'distracted' from driving! No more CB's, no more Ham radios, NO SMOKING, no
eating, no talking..... NO, NO, NO! We can't have anyone distracted while
driving!

Your statistics mean little.... statistics can be used to prove almost any
point from EITHER viewpoint.

This would also apply to commercial users, taxi cabs, wreckers,
plumbers, any NON-emergency radios.

Also, the Councilman then implies that a one handed/armed person CANNOT
operate a vehicle.

The point is not having you attention on driving. Such as dialing a cell
phone, writing on one of those dashboard notepads while talking and
driving. It isn't just cell phones, I drive a lot on the interstate and
see a lot of drivers READING while driving. You can actually spot them
ahead of you. They slowly drift out of lane and then suddenly kerk back
into their lane. Plus it is a perfect time interval between jerks. They
have a built in timer but are totally oblivious to what is around them.

This is why I am totally againest the new viewable navigation and
internet devices as they presently are. If you have these devices, they
should not be viewable by the driver, If they are driver viwable, they
should be inoperable while the vehicle is in gear/moving.

I also wonder hao many hams are quilty of having their attention
deverted while changing frequency or using a phone patch.

Plus, think of all the possible accidents as a driver suddenly attempts
to cut across a couple of lanes of traffic to get on the shoulder to
quickly answer an incoming call.

Careful: Your "screwdriver antenna" could be confused for using a screwdriver
AS an antenna. I have actually done both. It can be amazing how low in SWR
some household tools can be. Jewelers' screwdrivers, stuck into a female N
connector, work really well for 23cm RX.

Does anyone know how to figure P.E.P. for a AM modulated wave at 100% ?? If I
have a reading of 35 on my watt meter of the carrier is it 4 times for the modulated wave at 100 % ?? Are P.E.P. amounts only for modulated waves not carriers?? I have a amp that puts out 140 watt P.E.P. is that 35 watt carrier times 4 at 100% to arrive at 140 P.E.P. ?? Thanks !!

>35 watt carrier times 4 at 100% to arrive at 140 P.E.P. ?? Thanks !!

This PEP type of wattage measurement is used mostly for a modulated wave. A pep wattage is a wattage measurement for a brief period of time.The time period chosen is at the top of a modulation peak. For example just take the rms value of one RF cycle at this peak and then square it. Then just divide by 50 ohms. OR.....Vsquared/R = W

A standard 4 watt carrier can also be measured as a pep wattage. Since there are no modulation peaks all the RF cycles are the same amplitude. When this happens 4 watts average equals 4 watts PEP.

Upon 100% mod the modulated amplitude doubles the original carriers amplitude. A doubling of this voltage represents a quadrupling of the power. Or a 100% modulated 4 watt carrier will now measure 16 watts PEP.

Not all AM transmitters are adjusted for linearity (cleanliness). Some may have much more than the above 4:1 ratio of carrier to PEP wattage. Many times this is intentional.

If you have a 140 watt pep amp you would want to read 140/4 watts of carrier. Or 35 watts as you said.

Well, as much as I think a 'cell phone' law is BS, I DON'T see how a cell phone type ban would be considered ok and not supporting the ban on CB and HAM would be hypocrisy.

Cell phones are 'duplex' devices. In that sense, a person is talking and listening interactively . With a 'one way at a time' type device, there is MUCH less distraction to the driver.

When the person gets into a 'full duplex' conversation, especially though a device that limits overall interaction, they tend to concentrate on it. They still do the 'wide band' type interface actions though, like facial expressions, waving of the hands, and probably others. Watch some time, you'll see people on the cell phones waving, nodding, smiling, smirking, whatever. Do they do this with 'half duplex' devices? Nope, or at least, not near as much.

OK, why don't they do this in person in a car. Well, they do. But I think not as much. Or at least, it's not as distracting to driving in person, possibly because the interaction is still 'wide band' and is closer to what they've probably done all their life in social interaction.

Hmm, anyone who doubts the interaction of the TYPE of communication should try this experiment. Take a motorcycle, I know, dangerous, and try to maneuver around a 'test site' like a parking lot with a drivers test course on it. First try it with a hands free cell phone and a headset. Talking the whole time. Then try it with a 'half duplex' radio, something with a handlebar mounted PTT switch. THEN try it with a handheld mic!! Finally, try it with a hand held cellphone. I've done all but the last on my Gold Wing. The difficulty from hands free phone (with a headset in the helmet) and the PTT on the handlebars is just 'different'. But still distracting. Distracting even to at times make me forget to LEAVE GO the PTT! (I will just mentally 'let go' the radio and drive when needed, then realize OOPS, and go back to the radio. I have a friend that's a former F4 pilot, and he usually manages to blurt out 'stand by one' and then just goes away. Driving should be number one priority. Suspend all else when necessary. I guess some people just can't do that. What's the solution? Ban their cell phones? Hey, they shouldn't be driving to begin with!!

As to other distractions... I see the makeup, shaving, and reading
all the time. About 4 or 5 years ago I had just bought a digital
camera (I know, what does that have to do with anything, but wait
a second...) and I was commuting to work on the Mass Pike.
One day it was snowing and getting slushy. I almost got rear-
ended by this idiot about 3 or 4 times. Most weren't real pumpers,
but one got the juices flowing and was so close it gave me a rush.
He was READING A GOD DAMN MAGAZINE!!!! Well, at the
next stop and go stop cycle, I opened my door, got out, made a
snowball, and heaved it at his windshield, yelling "WAKE THE
F___ UP!!!"

Well, he took a bit of exception with that. He ended up pulling out
a 35mm (No, not a 9mm! (But then, I had mine in... NEVER MIND!))
and 'flashing' me. I don't know what he thought he was doing. So
I pulled out my Nikon and 'flashed' him back. Only I got some beautiful
digital pictures of him now driving with a magazine over his steering
wheel, in a snowstorm!

As to the other comment about navigation devices... At one point
I thought it was illegal to have any video screen that was visible by
the driver. I know that GM actually got a waiver from the FED for
the Buick that had the CRT in it. So it's amazing if the law was
changed just in time to make it legal to be distracted by GPS.

And yes, I have GPS. And I HAVE run it in the car, with the laptop
on the seat, or being held by one of the kids. But then, taking a
quick glance on an interstate is NOT the same thing as trying to
look at a display to figure out where to go in crowded traffic. Usually
I use it as the kids to tell me where the next turn will be. In that
regard,
used responsibly, I figure it's less dangerous than a map. Especially
since with the GPS I have the route already 'pre-planned' to a greater
degree than I ever did with a map before.

Why not ban passengers. Certainly they can be very interactive.

Ban Howard Stern. He can be a distraction.

There are numerous activities and circumstances that can
bring out bad driving in bad drivers. We can't ban them all.

All we can and should do is ban or punish bad drivers. Don't
punish people that can handle multiple tasks and distractions.

Im sorry about all the question marks but, I sometimes find my post faster if I use something that sticks out like a sore thumb...(LOL). Ive been looking around at different websites for various radios....ie; Browning, CPI, etc. And im wondering if there are ANY websites for Trams? Jeez......I just saw the CPI web page and all I can say is, this guy did a nice job but picked a TOTALLY "SAD" radio manufacturer, and radio, to have a website for. The CPI 2000 was probably THE WORST SOUNDING AND PERFORMING RADIO OF ALL TIME.......(BAR NONE) the transmitted audio on those things ALWAYS sounded nasily, no-matter what mic you used on it. I have even went so far as to add a equalizer onto one for a friend of mine......AND IT STILL SOUNDED HORRIBLE........now, WHATS UP WITH THAT ? My question to you fine folks out here is......are there ANY Tram sites on the WWW ? if so, where are they ? The Tram D201/201A series radios were "THE BEST" sounding, performing, receiving, and transmitting radios EVER made for C.B. use....(Except for the Yaesu FT 101E) now that was one awesome AM rig, (I still have mine with the plastic film on the face plate) "Cherry" "Mint" less than 50 hrs on it ! If anyone could help me out with my question, I certainly would appreciate it,.......73.......Frank.

Message-ID: <CTLd5.4976$t%4.57032@typhoon.kc.rr.com>
Source record: 45043

I just bought the following set-up and think I might have been hosed (hopefully my loss is another person's gain)... I must admit complete ignorance to CB's and electronics (well, the tech part of it)

I wanted a CB in my car to listen to while covering my sales territory (OH, IN, IL, MI, WV, KY, MO). I spend a good bit of time on the Interstates and figured a CB could keep me company and keep me away from the friendly state troopers.

I couldn't find much about any local shops in SW Ohio and wound up stopping at a shop off of I-75 towards Toledo. I left with...

Uniden PC68LTW - $119
Wilson 1000 (Mag mount) - $79
"Super Mod" - $37

1) The tech wired the power off my fuse box which I thought was odd, he said this was the best way.

2) He said the "super mod would dead key 10 and swing 30" - it sounded good but I think I was caught hook line and sinker. I know 4 watts was legal, but he said with 4 watts all the truckers would talk over me since they all have their radios tweaked and peaked.

He ran the SWR meter and got readings of just over 1.7 on 1 and 40 and just around 1.5 on 20. The ohms were around 60 (I think).

Can anyone with a greater knowledge help me out here. I read the FAQ and did learn some stuff to help, but am still a definite newbie.

* Is that super mod a scam? What did it likely do? Did it possibly do more harm than good?

* When I did a few radio checks, most people said the normal "sounds good" but a few said it sounded like I was whispering and I needed more power.

How am I likely going to get the most bang for my buck? I got what I think is a good antenna, and a decent radio. Would a different mic help me sound "louder" and not always get talked on? I don't want to spend big bucks to get an illegal amp, but want something that sounds good and clean and can transmit more than a few miles on flat ground.

Thanks in Advance

Any idea where I can get a mic cartridge for a +2?

Also, the Turner Super Sidekick is a full sounding mic with lots of base,
and their +3 was also a good mic, but not quite as much base.

sounds like you got a pritty good deal....I don't care for the
super mod kits. seems like a waist of good money but they do
make the radio swing up more in power on the voice peaks...he
done ok on hooking the radio up to the fuse box as it doesn't
draw that much power from your system. also it lets you turn off
the radio with the key. .... the swr sounded ok and
should work just fine.....

good luck and have fun.

Sounds like you got a good deal. Yes, a power mike will help you to be heard. The supermod is a scam only if it wasn`t done or if it was done poorly. Even four watts is plenty as long as you have good modulation. That`s where the power mic comes in handy. R.B.

These prices are not bargains, but they don't justify
a claim of being hosed either.

> 1) The tech wired the power off my fuse box which I thought was odd, he said
> this was the best way.

For just a radio that's okay.

> 2) He said the "super mod would dead key 10 and swing 30" - it sounded good
> but I think I was caught hook line and sinker. I know 4 watts was legal,
> but he said with 4 watts all the truckers would talk over me since they all
> have their radios tweaked and peaked.

That radio won't hold a 10 watt dead-key. The "swing
30" part means peak power. The textbook relationship
between peak power and dead-key is 4:1. In other words,
if the peak is 30 the dead-key shouldn't be more than
25% of 30 or about 7 watts. When the dead-key is too
high you sound weak. There is also an increased chance
of damaging the radio if something were to happen to
the antenna.

> He ran the SWR meter and got readings of just over 1.7 on 1 and 40 and just
> around 1.5 on 20. The ohms were around 60 (I think).

Those readings are okay, although Wilson 1000s can
usually be made even better than that. Sounds like
the whip may have been a little bit on the long side
and he didn't want to cut it.

> Can anyone with a greater knowledge help me out here. I read the FAQ and
> did learn some stuff to help, but am still a definite newbie.
>
> * Is that super mod a scam?

If he sold you some type of kit and then added a labor
charge to that, it is. If what he calls "Super Mod"
is labor only, it was a bit overpriced but not a scam.

> What did it likely do?

It increased the dead-key and peak power. Stock radios
are limited to a 4 watt dead-key and 16 peak watts--and
they usually don't even do that. 3.25 to 3.75 dead-key
and 10 to 15 peak is typical for a bone stock radio.

> Did it possibly do
> more harm than good?

The 10 watt dead-key is a little much, but it shouldn't
be a problem as long as nothing happens to the antenna.

> * When I did a few radio checks, most people said the normal "sounds good"
> but a few said it sounded like I was whispering and I needed more power.

The dead-key (aka carrier) is too high. The carrier
doesn't convey any information. There's no sense
wasting alot of power on it. Setting it to be 25%
of the peak wattage is as high as it should ever be.
Believe it or not, lowering the dead-key (as long as
the peak power remains the same) will actually make
you sound louder. Your range will remain the same,
but you will sound louder and more impressive. It's
not uncommon to set the dead-key at 15 to 20 percent
of the peak power in order to sound louder or match
up to an amplifier.

> How am I likely going to get the most bang for my buck?

Retune the radio and get an amplifier.

> I got what I think
> is a good antenna, and a decent radio.

You did.

> Would a different mic help me sound
> "louder" and not always get talked on?

A different mic will give you a different sound.
The radio has plenty of microphone amplification
built in, so don't fall into the "power mic" trap.
To sound louder lower the dead-key power but make
sure the peak power doesn't decrease. To not
always get talked on you'll have to get an amplifier
so you're in the same league with the other guys.

> I don't want to spend big bucks to
> get an illegal amp, but want something that sounds good and clean and can
> transmit more than a few miles on flat ground.

Your set-up probably does that now. It sounds to
me like what you really want is more loudness and
power. A small, $100 amp (like a Blue Face Palomar
225 with the SSB delay defeated) and the proper radio
tuning (shouldn't cost more than another $20) will

give you an impressive sound, 2 to 3 times your
current range, and a better chance of being heard
when going up against the other guys. These days
having a small, 2 device (faceplate values of 150
to 350) amp is the norm rather than the exception.
If you want to be a player at all, you have to do
the amp thing. A small, relatively inexpensive
amp will give you a 10 fold power increase. That
kind of an increase is well worth it--that's why
everybody does it. You don't have to buy a new
one or do it right away. If you keep your ears
open when you're on the road, you'll very likely
hear about someone who needs money and is willing
to sell their amp for a reasonable price. Since
you're not familiar with amps, just remember the
brand name Texas Star. Depending on the level of
desparation, you could come up with a Texas Star
250 or 350 for $100 or less, or even a 400 or 500
if you're really lucky or are willing to spend a
little more. Then it's just a matter of having
a decent tech retune the radio to run the amp
(lower the dead-key to 2 watts for a 225, 250 or
350 or 4 watts for a 400 or 500 while maintaining
the peak power) and installing the amp.

> Thanks in Advance

You're welcome. I hope this helps.

Speech processors only help radios where the
modulation limiter is intact. When the limiter
is defeated the processor causes excessive
distortion and doesn't get you anything that
simply defeating the limiter would.

i sent them a email about there abs1600 ant, asking about how much it
would cost to be shipped to s,bar-cal.
the reply i got was the price for the ant and (witch i all reddy knew
from there web site) but not on shipping? they said they would get me a
price and never heard fron them again.
any one ever deal with these poeple? it does`nt seem like good buisiness
practise? any comments. thank you for reading.

Hello Mike: Here is the MaCo Web site, that has all their Antenna assembly instructions, which includes all the element measurements.

http://www.majestic-comm.com/maco/support/index.htm

This is truly a treasure of CB Antenna reference. This info just isn't available anywhere else, it should be greatly appreciated, due to the fact it is all proven and working.

10watts dead key??? That is way too much. It would be better at say 4-7
watts dead key. 10 just makes it too hot.

>2) He said the "super mod would dead key 10 and swing 30"

Out of those radios, about 7w dead key and 25w swing realistically with a
general tune-up.

>* When I did a few radio checks, most people said the normal "sounds good"
>but a few said it sounded like I was whispering and I needed more power.

Set your mike gain between 2:00 and wide open (fully clockwise) and hold the
mike about 1-2" from your mouth, you should be fine.
Overall, you got a decent deal, a little steep on the radio and tune-up, but a
good radio and antenna.

I too was wondering where I could buy a mic cartridge for the
Turner +2. One of the +2's I bought had a pin hole in the aluminum
diaphram. It does not effect the mic operation at all but nevertheless
I'd like to make it perfect. The original cartridges seem to be quite
sturdy and should last along time (it seems). They are already about
30 years old now! All that I know is that these mics sound Great
and can still kick it out.

As for the Turner Super Sidekick, I used to have one of these back in
1973, put it away and never found it again after all these years.
But I remember I did not
like it as much as the Turner +2. It did not go as loud from what I
remember but did have good tonal quality. Now that I am older and
much more knowlegeable than I was back then, I know that it is the
preamp compressor of the Turner SideKick that limited its loudness.
If I ever find that sucker again, I will see how I like it today and if
need be, disable the audio limiter circuitry in it so that it can go as
loud as the Turner +2 preamp.

Unit 824, Audioman is back out.

I have a Silver Streak 350 Amp for sale. It does 120w on low and 350 on high. It has a preamp and SSB mode. I have had the amp for about 2 years. I used it for about a year in my truck. It has a few light scratches on it. All controls work. I have my eye on a beautiful screwdriver antenna and need to sell the amp. I no longer use the amp, since I got a bigger one. The Silver Streak really talks. I am asking $165 on it. Please e-mail for info. Thanks.

Use a 3 or 4 watt variable @ 250 ohms or a 6 position switch (Radio Shack) with different value resistors on it and you can have an adjustable volume on your talkback. 50 to 220 ohm range resistors for most applications will work. Use 2 watt carbon film or 1 watt flameproof to keep them from smoking if it happens to squeal on you. Keep the power mic's turned down! Radio Shack won't have a 3 - 4 watt variable though. Fair Radio Sales, Hosfelt Electronics, Mendelson Electronics (MECI) or other electronic surplus houses will have the large variables at reasonable prices. Don't use an old volume control out'a the junk pile! POOF smoke it the second you adjust it while talking.
Have fun!

That's too big of an assumption. Expecting an Extra (or any other amateur [i.e., non-professional]) to have knowledge of *every* HF antenna ever designed is asking quite a bit.

It's really no different than what you're doing -- building a version of that antenna rather than selling a design of your own which you've modeled and perfected after hundreds of hours of exhaustive research. Basing your antenna on someone else's design doesn't place you all that much farther ahead of those Extras you condemn, OM.

From: Speedbuggy714 <galaxy1@zoomnet.net>
Message-ID: <ezTd5.524$qe5.128007@nntp3.onemain.com>
Source record: 45175

Hello,
Signal Eng. makes a True Quad beam for 11 meter operation. It can be switched between Vert. and Horiz. with a switch box. It has both connections on it and a special type of "Gamma" adjustment. One for Vert. and one for Horiz. I own one and use it daily. I also switch between Horiz. and Vert. with a switch box inside the house. It works fine. Good SWR on both lines. Very good front to back ratio. If your not right on them it is very hard to hear and talk to them. This is the only company that I know of making this type of Quad with the special matching network. It is fairly simple and could be duplicated by the home builder but would almost have to be seen first to do so. I personally did not use the wire they sent with the beam kit and instead went with a Teflon coated, less stretchy, larger diameter wire for more durability and larger bandwidth. (Holds the SWR better over a wider area of frequencies) If you try one of these quads, after getting the SWR set you should not rely on the holding clamps on the matching system by themselves. Solder the connections in place after all adjustments have been made. I used a 1 to 1 Ferrite Balun 8 feet down from the feed point just incase there were any common mode currents induced on the lines. (Vert. & Horiz. coax lines) Ferrite balun's are explained in the ARRL antenna handbook. The Quad is not as broadbanded as a half wave Yagi but using larger diameter wire helps. Paint the fiberglass spreader bars with flat black Krylon exterior spray paint for longer life and protection against the UV rays. This works great for any fiberglass stick antenna. Use black or dark colors as they resist UV rays the best. You would think white or bright colors would work better at reflecting the light but this is not so when it comes to the UV rays......Off subject..... Try using a white plastic wire tie and a black plastic wire tie on something out in the sunlight for a year or two. The black one will still hold where the white will dry out and become brittle and break.....On subject.... Anyway I like my 4 element quad much better than the Moonraker 4 it replaced. No more static from the storms and man made interference. Since it is a true full wave antenna you do not get the signal fading when listening to skip. As the incoming signal switches from vertical to horiz. from bouncing off different objects, man made OR particles in the ionosphere, the received signal changes polarity. This gives you the fading in and out as you are listening to distant stations. The full wave quad receives both polarity's at the same time so you do not get this fading as the signal shifts it's polarity while your receiving it. The only thing you actually switch with

the switch box is your transmitted polarity (Vert. and Horiz.).
On a Yagi type beam your switching both transmitt and receive
polarity..... Ok, nuff said, want to know more buy the
books.....

Have a good one!
Mike

Bill Nelson wrote in message <8l63jvmfp6@b
>How are the "grounded"?

One side of the driven element (wire) is connected to the center of your coax.......on the other end of the driven element (wire) which is a full wavelength long you have a connection to the shield of your coax. Hence "grounded antenna" Electricly this is a dead short but as far as RF is concerned...... A good talking antenna.......

I have seen yagi antennas constructed using the
>"plummer's delight" method, but no quads. The quad driven element has always
>been insulated from the boom.

Yes it is insulated from the boom by the spreader bars but it is still grounded via the coax shield. This makes them very quite to. They recieve very little " white noise" and electrical static. Electricly shorted means all electrical static is shorted to ground and only RF is recieved.

Brian,
Sounds like your doing it correctly. You do all the tuning or
adjusting with the antennas mounted where they will normally be
used, of course. You might check the grounding, that's almost
always where problems start with mobile antennas. When phasing
antennas SWR will change, so you have to expect that. The best
you can do is to keep that change within reason.
Good luck...
'Doc

But I would think that anyone who got to 'extra' should at least have a basic understanding of the concepts, not be a total appliance operator. ESPECIALLY when it comes to parts in the box.

Geesh!! Well, it LOOKS ok. These extra parts must just be for looks!!

Yeah, right!!

Hey, I don't know that much about antennas and antenna theory. But I sure know that if I buy something like an antenna, I'm more than likely going to use all the parts in the kit! And no, I'm not THAT much of a novice either. I've built multiple VHF, UHF, and various microwave units. My latest project was my K2 (www.elecraft.com) which now has relegated every other piece of HF gear I own to the storage shelf, or to the 'for sale' bin. (Although it might be nice to pick up the RS HTX-10 to get 10m FM.)

well let me make this remark then to you people and you sir .
i did post prices at one time and a lot of these's so called dealers
flamed me and said all my products must be refurbs.
well sir i have been in this business for 18 years and own 2 shops
in 2 large truck stops here. and i am i the making of building a
3700 sq. foot building with store front right now.
you see every time some one e-mailes us and they find out just what we
are all about, and how we do have the lowest prices around.and i dont
mean by pennies either . and yes i do have overhead and yes i do buy
bulk this is the best way to get the best prices. you see this posting
of mine started about 1 year ago when a driver came into my shop
and told me about this news group so i checked it outand here i am.
i will also say this i have picked up a whole lot of new customer's
and 10 or 12 c.b. shops around the contury and im not going to say
names here to avoid problems and fights. and they were buying from
distribitors also but they found out i could beat there prices.
you see im not in this business to make a killing and to get rich.
im doing this because i love this work and i dont have to work for
anyone else to make ends meet this all started when i was a kid
and it was a big hobby of mine. and over the next few years , all i
heard on the radio was drivers talking about shops ripping them off
and the high prices they had to pay. so after a whole lot of research
and no sleep i found a way to help the drivers out and i have been
doing it all this time. well like i have been saying my friends over
the years you can't judge a book by the covers, you must always
open the book and do a little reading.
so my friend good luck to you , and maybe one day you might open your
eyes and see the world for what it is and not what you think it should
be.
oh almost for got one thing don't be picking on hillbilly dave either.
he is very good people and nows whats going on out here .nuff said for
now ,have a good one and god bless to you all.

to you sir. you seem to have things all backwards to some point
the real fact is the majority of the public do spend time trying to
find the best prices around. here is just a short fact. the pesron
wanting to buy a new car is going to spend 8 to 10 weeks checking
out prices at different dealer's from news papers ect,
and the list goes on. you see this is a high tech era we are living in
today and it is going to get worse very soon.
you see my friend you have to work hard to compete. competition is
what this country is all about .
well let me give you just one more thing for you to do, sir.
try and beat this.

cobra 29 nw st with complete alignment ready to go 99.95 + 7.55
shipping anywhere in this country. and one more thing sir
astatic 636L mic 24.95 .
here is you home work for you to do.
and no im not trying to be a smart ass ! just the facts and only the
fact's
have a good one my friend and GOD BLESS!!!!!!!

I have a blue +2 base mic that is missing the amp board and base.
In other words, the head, the housing, the mic element itself,
the volume control and volume control board are there. I'm willing
to sell it as I prefer the +3s (compression type) to the +2 and
Super Sidekick (straight amp type). I'm want to sell it whole,
and I'm not going to give it away. If you'd like to make an offer,
submit it via e-mail.

They all make you sound funny (unnatural)--that
comes with the territory. There's no way to
increase average modulation within the confines
of a 100% maximum without changing (for the worse)
the way you sound.

> but this guy makes a lot of claims and I wondered why this one
> cost $125.00 and Bills2way.com sells one for $40.00. What's the difference?

One is probably more elaborate than the other,
but the same still holds true. You'll sound
more like yourself without any processing at
all. If you want more loudness, range and
power, the mic end of the equation is the
wrong place to be. The other end (RF amp and
antenna end) is where the big improvements
happen.

If you want good quality at low power and excellent range then get a ham license and get a VHF FM radio. There is no static and the voice quality is beyond anything you can get with AM. Catch is that you have to do a little studying but it is well worth it.

3221. Re: 10 watts from stock radio

Newsgroup: rec.radio.cb
Date: 2000-07-21 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <nl9e5.358044$MB.5690595@news6.giganews.com>
Source record: 45251

Your math works,

However, most modern radio chassis have a 7 watt audio transistor, enabling them to achieve 100 percent modulation of a 14 watt carrier, in theory.

In actuality, they can go 10 to 12 watts and still maintain 100 percent modulation.

YMMV.

Toll Free

SWR is found by taking readings with a directional watt meter. The formula
is

1 + square root of (reflected power / Foward power)
divided by
1 - Square Root of (reflected power / Foward power)

of course if improperly installed it could no doubt. The most important thing is contact and good contact as in crimped some way either through crimp or pressure. Solderless are nice and fast but the solder is worth the trouble however they can be installed improperly also. Just make sure the center pin is not shorted to the shield. use an ohm meter and remove the antenna if needed. If done correctly the outter connector screw on part should be at the same continuity as the frame of the vehicle.

A 2 way conversation is a 2 way conversation
no matter what the duplex...

>Cellphones are more and more in the hands of "casual users",

I agree that more cell phone users means more accidents. More people driving from the normal population increase also means more accidents. Should we outlaw new licenses? That would decrease accidents...

>and "no hands on the wheel, one eye on the road" when dialing.

I can dial my cell phone with one hand, no problem. I program it so I only need to push 2 buttons and send. I hold it up by the windshield so that I can keep my eyes on the road when dialing, which is a heck of a lot safer than most ham and CB mobile installations that have the rig mounted under the dash and you really have to take your eyes off the road to use them...

>What is worse with me, is that I need my reading glasses to see the
>small numbers on the display and dialer.

As I've said before, if it makes you uncomfortable to drive and talk, then don't. But don't spoil it for those of us who can...

>I often pull off to the side when using the phone,

If they do pass a no cell phone law while driving, watch out for those wild swerves to the side of the road. You know, the phone starts ringing and you have to get stopped to answer it before the caller hangs up. That's safer???

Damn, now after all that take a deep breath and answer me this, is it
better to ad on elements to my existing flat side or go with a quad instead?
Will I get better performance out of a 7 element flat side or 7 element
quad?

Hello,
I was wondering what you folks think would be the best radio value if I want (am,ssb,freq counter, and the ability to convert for extra channels)? Cost is a big factor for me on this one too!
thanks,
Ken

What do I do with the tube? When I take a piece of toiletpaper in that moment of need,will the momentum that causes the roll to spin change stations rapidly? Won't the water in toilet provide a stable ground if I put a 3rd nail made out of gold into the potato and run a wire into the toilet water? Can your tanking coil hold more than my porcelain one? Will I get sh*t reception?

3233. Antenna Wire Suggestions

I need a recommendation on antenna wire for building a dipole. This will be layed across my roof since it needs to be hidden well due to antenna restrictions in my neighborhood. Also, I might have to keep the jacket on the wire and if so, is this a good idea? I need something that can handle a fari amount of power (about 300 watts) What should I get and where should I get it? What size gauge would be best?

thanks

First Scenario:
The big TV in the living room is giving me a headache again. My radio interferes with it, amp or no amp. I have tried a TVI filter on both the radio and TV but it still comes over loud and clear. Is there some type of "proximity interference" where since the radio is kinda close to the TV it will interfere with it? What can I do to try and fix it? Are there other antenna filters out there that will fix this problem?

Second Scenario:
Another TV In my house is giving me interference and I am giving it interference as well. It gives off about S1-3 of noise in my radio when it is on and I come over it pretty bad. What can be done about both types of interference? I haven't tried filters with this one yet.

When I talk about interference, all that really happens is that my voice comes out of the speakers. There is no cross hatching or any visible interference but the audio comes over almost as good as the radio's reciever itself. Any help is appreciated!

Thanks!

Hello blutarsky: Is ok G.I. but photatoe and toielet tube puts out very
little. Only old farts on moress code.

Use New Design Mastodon 5000 Ground Plane Antenna (is more bullet proof
than Penetrator 500) has much low loss impedance matching device. Not
windings around toilet bowl.

Got 2510 radio, and oldey but goodey Pride DX-300, with 4CX350 tube,
talk to all local and dx type of guys on cB.

Listen to Rock & Rol musick, live out in Mojave Desert (is real hot now)
drink cheap rot gut beer, and VO wiskeyy. Have many friends come by
Mojave Desert shack, and see home on the antenna range, drink mass
quantities of cold beer in hot desert, and BBQ up mOjave Desert rabits
and crows, got big cat that catches them. Is slide on down to desert
pull cork and tell lies. Go to Mojave down towN bar and shot pool, and
listen 2 T-Bone Sally, & drink mass quanties of store bought beer. Hop
train in Mojave train yard, and hop off in next 12 miles, hope train
goes slow, if goes fast end up in Bakersfield, ol lady get mad if have
to go 2 bAkersfield to go get.

nExt year we is ah gettin a telegraph, will half to do code morese.

We listen and ah monitoor 12 AM, and 38 LSB in vast desert, is call for
J
If Mojave dEsert Don comes on 12 radio, tell em U is here to fix Bongo
Bob's still.

Jay in Great Mojave Desert, ...just down road ah ways from fillin
station..

Well, the jacket doesn't really matter. Although it will help prevent
corrosion.
I just use the 'clear' speaker wire. Cut to length, split in half, and
got two
sides of the dipole. And after just a few days, the clear plastic seems
to 'fog' in the sun and elements and very quickly becomes almost
invisible.

I have a 40M dipole up right now I run with my K2. I used the 18ga
speaker
wire. At work, we're about to run another 40M dipole with 22ga, to keep
it even less noticeable.

Definitely use stranded wire!!

With 300w, well.... 18ga should PROBABLY be ok. Hey, it's so cheap,
so what? I've seen a QRP setup using an IF transformer that the wire
was 'unwound' from and stretched along the top rail of a wooden fence
so that no one would see it. Sure, QRP is 5w or less, but that wire
is like THREAD. THIN thread!

If you have a 'colored' roof, then you may want to pick a wire better
matched to stealth. Your biggest 'stealth' issue may be the center
contact and the end supports.

Mike

Jeff Herman,

I didn't SAY I expected every Extra Class ham to know everything about EVERY antenna made. What I said was that I meet many Extras who have NO idea how to build (implied), install, and/or operate an HF antenna.

The principles of installing and using an HF mobile antenna are basically the same. You must know the importance of grounding, you must know where to place the antenna for best results, and you must know how to get the correct impedance at the feedpoint. In the case of the screwdrivers, I include instructions on installation and what each part is for. But they couldn't understand what I meant by "impedance matching". One fellow returned saying it wouldn't work, as had a few others. I looked at, and told him that his mount was not providing a proper ground (installation issue). He wouldn't believe me. So he goes to another ham friend who tells him the same thing. Corrected the mount issue, and it worked as it should. It is also true that some guys refuse to READ instructions--and I have been guilty of that, too. The fact remains that, as the requirements have lessened, the tests have gotten easier, the less "learning" occurs.

There is nothing different about a screwdriver as oppposed to, say, a Texas Bugcatcher except for the ability to move from one band to another without leaveing the car. All other issues aforementioned are the same: if they have trouble with the SD, they'll have trouble with any other antenna.

I specifically said that I don't know everything and that I am still learning, which, for me, is one of the fascinating parts of ham radio. I never bashed all Extra class hams. Least of all, I certainly didn't bash you personally. I don't know what you know; you don't know what I know. The screwdriver antenna is NOT the only antenna I have ever built, nor is it the only thing I do now--I just used that as an example.

Lastly, I have experimented with the screwdriver design in several ways. One thing I did, is replace the PVC coil form with phenolic/nylon, and increased the wire gauge to #14 which allows one to run full legal limit if one desires. I don't use that much power--don't want to be exposed to that much RF in a vehicle. I have also build an "inside-out" screwdriver using a 4" air wound coil (Bug Catcher) whereby the coil is on the outside of the mast and the fingerstock is on the inside of the coil. It works fine--I have had enough requests for the 2 1/2" version to make continued experimentation difficult. The one I am running is 3" on a solid phenolic form (solid), #14 gauge wire, and is equal to the

regular Texas Bugcatcher--convenience of the screwdriver and "Q" of the Bugcatcher. I ain't smart, ain't dumb, either. Don't expect you are either.

Source record: 45314

I just bought a Motorola System 500 CB model 550 with 40ch and AM/SSB. I was wondering if anyone knows of any mods for this rig as the mods boards have none. I like the radio and the output is very clean but I am looking to add a 10k switch and a little more power. I hate to put my 148gtl-dx in the jeep for fear of theft but I will set the Motorola up for base duty or sell it if I can't get more performance out of it.

Thanks in advance.

As Gary Coffman was fond of saying, an amateur test is an entrance exam, not a final exam.

A newly licensed driver has none of the skills nor does he have the mental catalog of possible road events that an the long-time-licensed experienced driver carries with him. Why would you expect any more from a newly licensed radio amateur, Tech or Extra? It's what we do *after* receiving the license that counts.

I have sold several items through ebay and noticed that if you put a
disclaimer "Illegal for use on Citizens Band" or for amateur use only,
EBay usually lets it continue! Try that before you give up if you
havent allready.

There was an article posted on a website somewhere, If I find it, I will do a follow up on it. It was about the Super Mod type kits. However there are some that do work, but they usually cost more than the price you stated in the post. Now with your other equipment, The radio and aentenna is a good choice. I wouldnt worry about them 2. The fuse box is a good place to connect it in case something went wrong, however new radios do come with inline fuses and can be hooked up anywhere with a moderate power source. As for the truckers, Yes, alot do have modded out radios and run linear amps to get over all the trash nowadays. Best bet for you to get your signal out is to go with at least 50 watts or up to 100 watts of power via a linear. And yes the microphone helps. I would recommend an "Astatic D104-m6b" hand held. They really push the radio well and are great sounding mic's. Good Luck and there is always other options as some users here may point out.

Read the FAQ. It ' tells all '.

And yes there have been two major updates in the past two days so I have announced them.

If you know how just filter me out. How's that for being agreeable?

No, that actually would be illegal.

All grounds, according to NEC, must be tied together, or they represent a
fire hazard, that if discovered, could cost you the insurance money.

Sounds like Socialism to me. People like you Mr. Scott, believe that the above is a common sense, intelligent, solution to lifes ills. What you fail to see is the slow but sure chipping away of our freedom. Society doesn't need to be protected. Our individual rights do. Keep it simple. Hold a driver responsible his or hers actions. Don't pass laws that chip away at our freedom.

Frizz,
First Scenario:
Try the torroid gimicks, on the TV feedline and a/c power line.
More
is better with torroids. Are you using a VCR to change the
channels>?
That's a no-no, VCR's have no shielding. Proximity does make a
difference
for some TV's. The further away the radio and antenna, the better
(best
distance for radio is half mile). Good luck...
Second Senatio:
Try all the filters, torroids, etc. For both senarios, make sure
all
connections are good if using TV coax/cable system. Try grounding
your
radio. If it's already grounded, try ungrounding it. Keep all TV
cables
as far as possible from radio stuff.
Last resort, tell family that TV rots their minds, make'em read
books.
Lie to teenagers, tell'em the opposite sex thinks reading is 'HOT'!

I would try ferrite beads on the speaker wires in the TV.

If that doesn't work I would put in a low pass filter on them.

It's been 10 yrs since I calculated any values, but had to do this inside a
couple
of phones in the college dorm to block my cb interference. Someone who has
the formulas fresh in their head might be able to calculate the right
values. I would experment with the values to get the desired blockage. It us
just audio passing on the speaker wires, so any low pass should work (within
reason) to block the rf. Parts should be available at Radio Shack.

```
------((((((((((--------- coil 220mh
|
speaker = capacitor .001uf source
|
------((((((((((--------- coil 220mh
```

Actually, there is a big difference between people using the telephone and a radio. People using the telephone, for the most part, don't think they can miss a word...they cannot put the dern thing down whereas, folks using the radio seem to have no problem leaving the other guy hanging for a few seconds while they negotiate a turn or whatever. Also, folks that are deeply involved in a personal call can and have lost track of where they are and what they are doing. I.E.: cannot stop conversation long enough to use a turn signal, weave back & forth, move from lane to lane, etc..

Some folks are better at it that others....your mileage may vary.

I would check swr on channel 1 and 40, adjust both antennas the same amount until you get your swr dip where you want it.

If it doesn't change over the whole band, then that might be as low as it is going to be. Then I would follow Doc's advice and check the grounding.

>

I will elaborate on the last line.

For someone that doesn't know much about CB's and Antennas.
The radio puts out power (4 watts) , and if the antenna length changes, or the coax goes bad, the radio final amplifier starts building up heat (power that isn't being radiated properly by the antenna) and eventually blows if you transmit too long.

Hope we have answered some of your questions JWU42.

3280. Re: tuning dual antennas

Newsgroup: rec.radio.cb
Date: 2000-07-22 00:00:00 UTC
From: Marconi <marconi390NOmaSPAM@juno.com.invalid>
Message-ID: <03e6ae67.4b498425@usw-ex0107-050.remarq.com>
Source record: 45199

Brian, I have found that RG71 100 ohm coax makes a much better co-phase transformer, one that exhibits at near 50 ohms match, with no noticable reduction in power or signal, for individually resonant dual antennas.
I know Iâ€™ll get some arguments on this one. Personally, I use 102â€□ SS whips in this installation but other types may work just as well.

Try the following procedure: divide frequency of operation into 5616.
Cut RG71 to that length. Double the coax evenly and remove 1â€□ of outer covering on each side of center being careful not to cut the shield.

I will state this caution to save being repetitive. DO NOT CUT CENTER CONDUCTOR OR SHIELDING!!

Spread the shielding open carefully in order to allow dielectric and center conductor to pass through. Carefully remove 3/4" of the dielectric. Bend evenly and press the center wire together small enough to fit into a PL259. Lightly tin the center conductor. Smooth the shield back over the coax and a RG8 259 reducer, seal the reducer. You can lightly tin the shield as well depending on how you install your PL259â€™s. I peal my shield, unsoldered, back over the 259 threads and then screw the 259 together. Check your total coax harness for shorts. Make pigtails for the other two ends and install to your individually resonant antennas. Check SWR making at least 3 readings as wide in band as is necessary in order to see the best SWR dip.

If OK, go for it. If not OK, then multiply the best SWR frequency by the original total starting length, not the 1/2 length. This will give you a new base number to divide your desired operating frequency by. You should need to subtract length. If not, you need to start over, your first cut was short.

Remove half the difference equally from both sides of harness at the pigtails and then remake the pigtails. Reinstall and check SWR, you should be right there on frequency with maybe a 1.1.0:1. This procedure will account for the adjustment for the velocity factor of the coax. If you know what the VF is, then include it in your original calculations and you should not need to make adjustments if the VF info is correct.

Of course your antennas need to be individually resonant at the same and exact frequency of operation, for the best results. Later you can install PL259â€™s at the antenna ends if you wish.

Good luck

Marconi

Hello Frizz: Yep just a long wire and a amp, that will create havoc with the consumer electronics big time.

The dipole antenna should be 103 inches long in each leg, this would be for channel 20 in the middle of the CB Band. And yes use the coiled up coax act as a balun, or you can buy a 1 to 1, Unbalanced to Balanced Balun at the local Ham Radio Store. This would go in-between the coax and dipole antenna. Then I would get the antenna as far away as I could from the TV and ect.

A dipole antenna can be made from some pretty small wire and be quit stealthy, if you have some tree's around, and skearm a bit. There was a local out here who lived in a apartment that of course didn't allow any external antennas to be put up. He used a dipole antenna supported by mono-fillament fishing line, and used white coax, and a white balun. It worked great, because it was up high, kind of off to a angle, and it was hard to see.

Again I suggest to ground the radio, to separate ground rod.

I'd give that a try. Good luck.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

Thanks, one more question. I have this catalog someplace for this store
that sells all kinda of antenna parts and equipment. They have a device
called a line isolator that is supposed to keep stray RF from leaking off of
the braid of the coax, or something like that. Do you have any info on
these? Do they work?

Hello Frizz: I have seen these, but I don't know what there are or how
they work. You might try talking to the sales guy there. They may just
be a 1 to 1 balun?

Jay in the Mojave

Try here..they have Uniden and many others listed.

http://www.copper.com/micwire.html

Also Astatic has an online mic wiring guide here

http://www.astatic.com/astatic_cb.html

Source record: 45210

Frizz,
Line isolators act the same way the coiled coax at the antenna
feed
point does (choke). I'd try the coiled coax before spending money for
the isolator. Unless it's a fairly new one, most line isolators don't
work. The 'cheaper' ones are ineffective, if you have to try one, go
for the top of the line model (higher power rating). Your probably
looking at the "Radio Works" catalogue, or at least I hope so, they
have
the only isolators that are effective.
'Doc
PS - Dump the random wire, nothing but trouble...

Separate grounds will introduce ground loops resulting in problems with rfi.
Also the results of a lightning strike can be devastating. Adding a separate
ground is asking for trouble.
Ron

3294. Re: grounding question

Newsgroup: rec.radio.cb
Date: 2000-07-22 00:00:00 UTC
From: Charles <charles@ab7sl.com>
Message-ID: <8lck3k$q22$1@nnrp03.primenet.com>
Source record: 45213

Equipment grounds can run to a separate ground rod but must also be tied to the AC service ground as well. This is the type of grounding required by the code. It is safer and as far as operating goes helps prevent ground loops which can introduce RFI feedback and deter from lightning suppression. Many Hams have multiple ground rods tied together but they are also somewhere tied to the service ground as well. The Amateur Handbook from any year has great instructions on station grounding.

Considering that you want your station pirmarily for listning, what you have
should work just fine. I wouldn't change much except for tuning the antennas
a little bit. I wouldn't worry about spending any more money on it.

In my opinion, going with a longer antenna is only going to make your beam pattern a little narrower, the gain resulted in adding the extra elements isn't goint go give you a much noticable gain.

I have used 4, 6, 11, 17, and 19 element beams, and the longer yagi will give
you a tighter pattern but the db gain is only about 3 or 4 more than the 4 element. So with that in mind, do you need more side rejection or will the pattern of a 4 element be sufficient? Usually about 30 degrees beamwidth before you get 3db loss in signal for signals on the side of a 4 element, and down to 10 degrees for the 19 element.

If you have seperate ground rods for different parts of your electrical system, there will be a resistance potential between them, and if lightning strikes)(or even static buildup), it will dissapate in that resistance. You can put in seperate ground rods, but tie them all in together with another wire.

Hi "NG",
There is now a world 11 Meter Band Data Base with many callsigns available. It is in the Microsoft Access dB file type. The file is zipped to 1MB and quick to download. This file is completely FREE and you may distribute it to all friends. Please also sign the Guest Book while you visit the site and any comments are welcomed. The link is below and once there please click on 11Mtr Directory's Hot Button to get the file.

Change your screen name or get an DMM, With a screen name like yours you should not need a schematic to wire a mic.

You have never meet Dr. KAVORKIAN, but my ex-wife did, several times, when
she worked at the Oakland County Jail. And for the record he did most of his
"volunteers" using Carbon Monoxide, after the Oakland Country Prosecutor
took away his first "suicide machine", which used lethal injection.
Kavorkian was a man who strongly believed in what he was doing was right,
and had the balls to go to jail for life to prove it. You on the other hand
don't even have to balls to sign your name.

Of course she is the "ex-wife" because she has a little problem with the
booze. Took her over 20 years to finally break her denial and admit she had
a drinking problem. How long is it going to take you to break your denial?
Or at least be a man and sign your name, and call sign if you really have
one. Oh, maybe your not a man, humm......

Here is a better one I found after a quick search:

THE MAN
WITH THE FOOTBALL
MOVES-OUT

DEFENSE..

The man with the football moves-out.
Defensive tackle, keeping count,
See's the helmet and the legs,
of the man, too quick,
Too sure, no doubt !

The man with the football move-out.
Be sure it's him,
Got to stop first-in-ten,
Grab the quickest, quietest shirt,
It's him !

OFFENSE..
The man with the football moves-out.
Close it down, That's what we're all about.
Block 'em, Cut 'em down, It's a rout !
Power Eye, Slot Left, Red thirty-four, Not a doubt.

Suck turf, Suckers !
Defense ain't sure, who had it last,
Pigskin's missing, maybe it's been passed,
No they don't see it, nor do I,
Only the carrier with the soot on his eyes,
And, maybe, the fans by the sides.

Superscore, Nice try, first-in-ten, by-and-by.
Rub your hands, Spit on the ground,
No-one gonna know,
How you did it, again.
Beware the evil-eye,
Smart fella, Slow moves,
Touchdown !,

That does it,
The team's, Still Alive !

That's certainly possible. I have found that the color is a pretty good indication as to the perm of the material. The darker materials are usually the higher perm... while the lighter grey materials are the ones with less perm.

I know nobody will change your mine Mr. Leland Scott, just like the drunk who thinks he does not have a problem. You will go to your grave and never understanding why these laws are very dangerous to our basic freedoms. I am not going to continue wasting my time to explain it to you. The URL's for the studies supporting the view that mobile cell phone use is dangerous are UTTER BULL SHIT and mean NOTHING. Hell more people die every day just because they wake up and get out of bed, than those hurt because of a cell phone. Maybe they ought to pass a law to make it illegal to get out of bed. What you don't understand is, it's all about money. Insurance money. Wreck your car, cell phone in your possession, a ticket will be given, insurance won't pay until you prove other wise. If you disagree with the conclusions, that's your problem. And yes I do have the balls to identify who I really am,
and I'm not afraid to take the heat for my views.

Socialism: Social organization based on government control of the production
and distribution of goods.
Does any body else see the relationship, or is it just me.

3331. Re: 10 watts from stock radio

Newsgroup: rec.radio.cb
Date: 2000-07-22 00:00:00 UTC
From: BLY <bly213@nospam.att.net>
Message-ID: <r47e5.10421$o71.663116@bgtnsc04-news.ops.worldnet.att.net>
Source record: 45261

First off, you will notice the carrier is stronger when you turn it up to
8 watts on AM. The audio may have seemed to be louder but I can
guarantee you that it most likely was not in percentage of modulation
of the carrier. When you turned up the AM power to max, it does not
mean your that your audio will get distorted (assuming that you are not
overdriving the audio preamp with a power mic to begin with). It just
means for that same audio mic level setting, it is not modulating the
8 watt carrier as much (percentage wise) as it was when you had the
AM power set at 4 watts. And if at that point you tried to turn your
power mic up to increase the % of modulation of the carrier at 8 watts,
you will most likely find that the circuitry cannot obtain 100%
modulation at all! The sopund of the audio change when you change
the AM power from low to max is subtle and I suspect most of the
untrained ears will not easily detect the change in audio characteristics
when doing this change. But if you take the time to really listen to the
difference, I guarantee you there is.

You can sound louder with higher quality fidelity audio by keeping
these stock CB radios AM power turned down to about 4 to 5 watts.
The AM voltage regulator will then allow the radio to swing with
upwards modulation when you talk. The voltage regulator is usually
controlled by the audio amp output to vary the voltage to the AM
RF final transistor. When you turn that VRn pot up to increase
the AM power output, you are actually adjusting the output voltage
of the AM voltage regulator stage. If it is max'ed out, then when you
talk, the audio voltage will have minimal to no effect on the
AM voltage regulator swing (because it is turned all the way up
already) and thus you will notice that you will have little or no more
Upwards modulation when you talk.

So it is a trade off of sorts. Slightly more carrier power to get through
some noise situations, but with lower and limited audio modulation capability,
OR
More audio modulation with a slightly weaker carrier (which might be just under
the
noise level in a conversation) but with large upward carrier swing that will go
over
the noise and make you be heard and percieved louder.

Unit 824, Audioman is out.

I would like to trade a Ranger RCI-2950 10/11 meter radio along
with a penetrator HB150 amp
for a good working laptop with CD rom and network connector.
Must be at least a Pentium 166 or better.

Details on this radio can be found at

http://www.rciweb.cadic.com/

Email me at

Hey Charles, like your web page.
Let me spell it out for you a little better.

Socialism: Social organization (FCC)
based on government control (licensing requirement) of the production (use)
and distribution (allocation) of goods (band width).
Do you see the relationship now?

Hi Aaron,

I have mused over the difference. Why OK then, bad now? Are the ergonomics different? The former mobile radios were usually push to talk, simplex or half duplex. Cellphones are full duplex. Cellphones are more and more in the hands of "casual users", not just reserved to "professional" types. The most popular seems to be the full handset ("..talkie") vs. the console/speaker/mike chord combination, requiring one hand to the side of the head when conversing, and "no hands on the wheel, one eye on the road" when dialing.

What is worse with me, is that I need my reading glasses to see the small numbers on the display and dialer. I often pull off to the side when using the phone, because I don't like the uneasy, gnawing feeling of not being in the same level of control of my detroit steel when on the phone.

73,
Clay N4AOX

I have a Johnson Whiteface forsale, but i didnt get it to work, i think it was a mic problem, so if you can get a mic wired for it, it will probably work.

That's exactly what NOT to do! The house electrical ground potential needs to be as close as possible to the radio and antenna equipment ground potential. All grounds need to be as close as possible to the same potential, that's the hard part of proper grounding.

At a glance, it wouldn't be what I would do, but what I wouldn't do. By the way, it's just not controls over radio I'm aganst. It's control over our life in general.
So with that said, lets pretend Amateur and CB radio as of today is no longer govern by the FCC. It is free and open to the world with out restriction. A course, much to my dislike, some controls are still needed, such as commercial, government, police, fire, military, ect use of the spectrum, and would still fall under the watchful eye of the FCC.
Now imagine, in your worst nightmares, the problems this would cause.
Just think of the opportunities for buisness to innovate new technologies to over come such problems. Better yet, comsumer product manufactures force to deal withTVI, legal amps made for CB! Better equipment, unknown possibilities. But then again Amateur radio might just be rendered useless, much like CB was in its peak. Who knows? All I know is that it won't be any worst than CB radio is, as we know it today. And in my opinion, thats not all bad.

There are far to many situations that
make that physically impossible to tie
antenna ground to house ground so a
separate grounding is better than no
ground at all.

I am lucky where I live as the water
table is high. I can take a pigtail 100
watt light and put one lead in the hot
side of the house outlet and attach the
other to my antenna ground and it will
light full brilliance.
Cheers,
John

3351. Re: Tough RFI fixes.

Newsgroup: rec.radio.cb
Date: 2000-07-22 00:00:00 UTC
From: Jay in the Mojave <jay123a@qnet.com>
Message-ID: <397945BB.82178067@qnet.com>
Source record: 45281

Hello Frizz: The TVI Interference problems can be a real jar of worms.

Its really hard to fix the interference problems from just advice on a news group, due to the many possibilities of things that can cause the interference problems. There is not a do-all fix.

Not being able to see your house, track in dirt, drink your beer, and bore you with war stories, it adds to the difficulty to fix the interference problem, or problems.

I would suggest that RF filters be installed on the speaker wires, as one of the others mentioned here. This is a good start. Radio Shack sells a ferrite choke, that can be opened up, and wrap the speaker wires around it to stop RF Energy getting into the electronics circuits that would amplify the RF Energy, and hear it over the speakers. Unshielded speaker wires run all over the house will act as a antenna, and pick up all kinds of interference.

Here are other things to consider:
1- Verify the antenna mast, and radio/amp is grounded.

2- If your using a fiberglass whip antenna, suggest you place the coax (at the antenna connection, at the antenna) in 8 to 10 turns into a coil with a 8 inch diameter. This will reduce the outside of the coax from radiating some what. And may help reduce the interference.

I have heard and seen to many interference problems that have been fixed by replacing fiberglass whip antennas with a ground plane type antenna. A possible fix?

Is your coax in good shape? I have seen just the coax replaced, and interference has been significantly reduced or eliminated. A lot of guys do not solder the shield connection in the SO-239 connectors, and this will bit you sooner or later.

3- Are the consumer electronics grounded, to separate ground?

4- Shielded speaker wire may also help.

5- The manufacture of the Big Screen TV should have some technical people in the inventory that might be able to help you.

6- Most large appliance stores will allow you to purchase a TV and take it home, and see if you really want to keep it, by looking at it. This maybe a cure for the TV that is jammin ya.

Here are some excellent books on the interference problems. Please let everyone know how you make out, and what fixes the interference

problems.

Ever tried any AM on 160m??....THOSE are the real AM'ers! Many run converted Broadcast equipment. Also lots of AM'ers on 80 & 40m and usually a few around 29Mhz when 10m is open.

Don't bother with the adding channels crap to the radio. If you already know
you want the added coverage, BUY A RADIO THE IS SETUP FOR IT FROM THE
FACTORY!
Get a "10 meter" radio such as a Ranger or Galaxy or the like and eliminate
the future headaches.

I guess this will monkey my question up even more, I have a wire antenna. Just a random length. I forgot to mention it but this might also be a problem. I am switching to a dipole but due to antenna restrictions, this will be located very close to the house (possibly hidden along the sides of the roof). So I am going to get some new coax to run this thing, should I do the 8-10 turns trick? Thank you and all the rest for the help!

Get the Uniden Grant LT. It has AM/SSB, has the best receiver NB of
all CB radios out there, is a good talker and is easily modified.
It is also available now with a $30 Uniden Rebate until 08/31/2000.
I think Copper's has it for $139.95 plus add extra for shipping.
Minus the $30.00 rebate and you get a new Grnat LT for $109.95.
Great deal for a radio as good as this one is!

If you can get a used Uniden Grant XL cheaper, that is just as good.
Also the Cobra 148 GTL's old or new are just as good, but cost more.

Unit 824, Audioman, back out.

Hey KW,

I used to not be interested in AM at all--abandoned it in the late '60s. But a friend of mine is really into AM (K4EDK), and I've begun getting interested in it. He runs a nice piece of Viet Nam era equipment for an Xmitter,and an R390 for a receiver. I have discovered my Icom 706 does a pretty decent job on Am if you run a little "juice" with it. AH HA! I just remembered the transmitter--T368. I hope to get one some day!

3371. Re: quad beam

Newsgroup: rec.radio.cb
Date: 2000-07-22 00:00:00 UTC
From: Speedbuggy714 <galaxy1@zoomnet.net>
Message-ID: <jfre5.1231$qe5.279371@nntp3.onemain.com>
Source record: 45351

The Quad would be slightly better in performance BUT it may not justify the price you would pay for an entire new antenna. It would be a lot cheaper to add to your existing beam and achieve "almost as good " of results. It really depends on the performance you are looking for. Are you wanting to increase receive as well as transmit range. Do you want quieter receive conditions as far as removing electrical and "white" noise? Do you want more directional capabilities? Do you want to be able to receive vertical and horiz. at the same time? A quad would give you a performance improvement in all these categories but you are paying for a complete new antenna.

Add more elements to your existing beam and spend less. You get an increase in transmitted range and a little increase in received range but no benefits such as receiving both polarities at once or reduced static and white noise. Not as directional as a quad. It is really up to you as to which way to go. Performance costs money..... How much do you want to spend?

Want the best? ....Buy the quad.

Want an improvement? Add the elements to your flat beam.

That's an emotional choice. The Skipper will blow the
doors off of the BL. A properly working Skipper 300
will peak at (swing) 600 watts. I have a PAL 321
(almost identical to Skipper 300) sitting here right
now that will do that with tubes that are far from brand
new. The 321 is for sale for $250.

3380. F.S. Ranger 2950 10/11 meter radio

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: kb2rev@aol.com
Message-ID: <20000722203218.11320.00001475@ng-fu1.aol.com>
Source record: 45360

this 2950 is the older style purchased 10-95. covers 26 mhz to 29.6 mhz and is
in very good condtion. comes with all the orginal stuff when new.
mic,manual,mounting bracket, and box. $ 150.00 plus shipping. thanks, Garry

315-894-0804

3381. F.S. Tubes:: 6je6 6lq6 6mj6

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: kb2rev@aol.com
Message-ID: <20000722203649.11320.00001476@ng-fu1.aol.com>
Source record: 45361

all these have been tested and are in good condtion. $ 7 each. thanks, Garry

315-894-0804

3382. Tube Socket

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: wpbrock3rd@aol.com
Message-ID: <20000722210540.02810.00000991@ng-md1.aol.com>
Source record: 45362

I am looking for a tube socket with an isolated ground for a 3CX10,000A7 tube, please forward any imformation or links to Wpbrock3rd@aol.com. Thanks!

3383. Re: quad beam

>a quad. It is really up to you as to which way to go.
>Performance costs money..... How much do you want to spend?
>
>Want the best? ....Buy the quad.
>

A seven element yagi will have more gain than a quad if the elements are properly spaced. There are a lot of these big antennas around with 7 or 8 elements that are just a rip off. A yagi with this many elements is going to be 50 to 60 ft long. Check around and look at some of the boom lengths. A lot of these antennas are only arounf 30 ft long, way to short, and the manufactuers are just selling aluminum at ridiculous prices. Five elements on a 30ft boom will do better than 7 elements on a 30 ft boom. & element guads are pretty much a waste. They accumalate gain quickly for the first 4 elements and actually have more gain than a yagi with the same number . After 5 or 6 elements the properly designed yagi will beat out any quad with same number of elemnts. After 7 or 8 elements the yagi will beat out any quad. Again this is talking about a properly designed and spaced yagi. Not what you usually see made by most CB antenna manufacturers.

Thanks for the offer Bill, but I am not too desparate. Maybe sell it to the original poster who was looking for it. he probably needs it more that I do.

BTW, I just bought an old Turner Super Sidekick mic today and it sounds quite nice! Dang, I like it. Maybe some day, I may get to experience a Turner +3...

Unit 824, Audioman is back out!

3385. Re: tuning dual antennas

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: mudduck23@aol.com
Message-ID: <20000722224516.09372.00000358@ng-cb1.aol.com>
Source record: 45365

Thanks for the suggestions everybody. Does it make a difference if you tune each antenna using the 75ohm coax or should the 50ohm coax be used? I also measured the distance between the antennas and it was only 86" so i'm going to try and move them farther apart to around 102".

3386. Re: CB's Honored Ancestors Website

Are you REALLY that stupid Ben...I don't think so. You ran a very negative posting that was basically non sense and you received the same back. Do you really think that us being humans can be unleashed with total freedom? I don't think so, I would LIKE to think so but there is always that human element that wants to strech everything to the limit. What about your home Bennie Boy/ Do you want maniacs driving by your home at an unlimited speed? I for one don't want my child killed by some a--hole who has relieved himself of all responsibility and driving as he wishes. What about our armed forces? Do you want to live in a country that has no protection from foreign invaders? That's government control isn't it Bennie Boy? You pay taxes for the armed forces don't you Bennie Boy? Humans by nature need a SMALL amount of intervention to keep them from walking over each other. No our system isn't perfect, no, I do not like what is going on today but it is the BEST in the world! I know, I've been all over the world. As for ham radio, I would rather operate DX under a more controlled atmosphere. I have absolutly nothing against CB or the operators...more power to them...as long as they don't bother anybody and create a problem for peaceful people...that goes for hams too! Get life Bennie Boy and try being positive, you may get results that you never dreamed of. Why does it bother you so much that some people like being hams?

3388. CB SSB - HELP

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: kal4cu@my-deja.com
Message-ID: <8ldpv9$6qa$1@nnrp1.deja.com>
Source record: 45368

I have a Uniden Washington base using a R/S 99 antenna that is 17 1/2 long. I have this mounted on a 10 foot pole on the side of my house at the highest point which puts the top of the antenna appx 35 feet above the ground. I do have trees within 30-40 feet of my house. I can't seem to get out on SSB. When using AM I have been able to talk appx 40 - 50 miles. I have problems also tuning SSB so I can understand both parties. If I tune 1 then the other sounds like Donald Duck. I am frustrated about this. Any suggestions/help will be greatly appreciated because I do enjoy my radio. I have received transmissions from all over the U.S.

All you can do is to tune the clarifier so you can hear both parties at a decent level. otherwise tune them in until they just sound natural.

3395. Re: grounding question

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: John Amero <" johnaNO§PAM"@island.net>
Message-ID: <397AB7F1.B309BA8A@island.net>
Source record: 45375

For me to tie into the house ground rod system means a direct connection to the ground rod wire by local code here which will require about 200 feet of #4 wire or larger I believe by our code, 200 feet from ground rod to ground rod is illegal. You can not go through the house in case the tie wire is hit by lighting and melted causing fire. #4 wire will not hold up to a direct hit and the length will still cause a RFI ground loop because of the such long length because of a high RF resistance than DC. The tower and AC service are at opposite corners of the house. So I am damned it I do and I am damned it I don't!
Cheers,
John

Subject: FRAUD ALERT: Please Read & Respond to State Police
From: amp357@aol.com (AMP357)
Date: 7/22/00 10:23 AM Eastern Daylight Time
Message-id: <20000722102355.09236.00001870@ng-cb1.aol.com>

I have received a call from Louisianna State Police Trooper Greg Ducharme in regards to an Internet Fraud case against Myron Breland;chocalatejay@webtv.net; also he is using Harry Prejan's FCC call letters(AC5PG) illegally to further commit internet fraud & may be using additonal screen names. If you have sent money to Myron at any address(at this time they know of 2; 1 in Louisianna & 1 in Texas) and did not receive the advertised merchandise,or did not receive any merchandise or a refund(my case), or have any information that may be helpful to the Louisianna State Police in this investigation, please call Trooper Greg Ducharme at 337-262-3341; starting this Monday 7/24/00 between the hours of 8AM till 4:30PM Central Time. At his request I have posted this alert on this site since this is where the items were advertised for sale by chocalatejay@webtv.net.

I saw this on the swap board. Anybody scammed by the above should repsond to the above directions....

If you are going to pre-tune the antennas individually, which is highly recommend, then us 50 ohm coax.

If you get a chance try the RG71 100 ohm coax I described earlier. I think you will be surprized at the results.

Marconi

Hello Red: Yes I have heard some Big Bear guys on the radio. I talked to a guy on 38 LSB, early in the morning (0h dark-thrity) but his signal was weak and hard to copy.

Channels 2 and 12 on AM, and 36 & 38 LSB, but mostly 38 LSB.

Give a call for Night Owl (Steve) he is just down the road, and has a new antenna on a 60 Ft. tower. He is on channel 12 AM most of time. He is the local Big Strap.

I'll give ya a yell on 38 LSB.

Hello Frizz and Doc: I agree with Doc, lose the long wire.

Get a ground plane antenna, with 4 each quarter wavelength ground radials, coil the coax at the atenna connector, and ground it. Put an American flag on it, for tree huging, butter fly chasing, communists, bed weters, busy bodies, nose pickers, done for the day if they brake a nail, low lifes, goof balls, home owners association types, and other assortied none American types, and tell em Jay said it was alright. Yeah!

Or ya can move out to the desert like me and put up what ever ya want.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

WOW!! Sure hit a sore spot with you. First of all, I agree that we humans need a small amount of intervention, as you said. Also our system, as you say, isn't perfect. Yes it is the best in the world, but that doesn't mean it can't be better. My major point is, many aspects of our life are being controlled for reasons other than what is just. Tradition and the preservation of egoes of a few, are not a just reasons to maintain such restricting laws. Laws that restrict the advancement of the hobby.
By the way, insults and name calling do knowing to suport your cause. Matter of fact, it shows your frustration when faced with opposing truths.
In closeing, ae4en, I would like to say, you too, need to get a life and WAKE UP!

Sounds like your system is working properly so far.

I have problems also tuning SSB so I can understand both
> parties. If I tune 1 then the other sounds like Donald Duck. I am
> frustrated about this.

It is the other persons radios that are not on frequency. If you are listning to 2 people and one is straight up on the clairifer and the other one is off to one side, that means his is slightly off frequency. No two radios seem to transmit on the same frequency. This is a normal problem with all ssb operators. Group conversations get hard to understand sometimes.

Most radios that have been modified to adjust tx and rx frequencies with the clairifier are easier to track in group discussions. Normally the rx is only adjusted with the clairifier and the tx freq is fixed by an internal adjustment that is not supposed to be adjusted by the general public.

How does your radio do one on one with another party? Can you hold a conversation or do you chase each other around the channel?

DT-001

Probably can't write you a ticket, but depending on local
ordinances,
he may be able to start proceedings on a local level, and you may end
up
in court. CB radio is a non-licensed service, and as such, local law
enforcement CAN have jurisdiction over certain aspects of it. It's
being done in some communities. So, you might check your local
statutes.

3425. Re: Antenna Wire Suggestions

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: dogyham <noone@nowhere.com>
Message-ID: <8lfj2beub1@nnrp02.primenet.com>
Source record: 45405

Use 14ga stranded wire . the reason you use stranded is because it will stretch and solid wire won,t (won't break as easy as solid)
use the formula 468 divided by the frequency to come up with the lenth of your wire .Cut the wire in half and one side will be hot and the other side will be counter poise. leave about 2 feet of excess hanging off the ends of the insulaters for trimming swr . You may even want to entertain the idea of a tuner because the antenna being close to the roof will change your swr with the change in temp. and humidity also will definantly change when it rains
Be prepaired. You will be horizontily polorized so You will lose 50% signal strenth transmitting to a station using a ground plain. however it will be kick ass for dx.
If any way possable make sure it is at 90 degrees from one another (the legs of the antenna) this way You will have more of a omni directional ant.
also keep in mind that the further apart the ends are the broader Your frequency coverage is.
Also make sure You have a good ground . the best would be a 8 ft ground rod about 6 ft or less from your equp. Use braided strap if available for ground wire this will help You keep tvi at a min.
Running 300 watts with a wire ant on 11mtr's that close to a structure will cause tvi and You'll find that a good ground will be your best freind in a case like yours.
73" and good luck

I have a new white Wilson 1000 magnet mount for sale. I bought it from Left Coast Radio last month and used it on my car for two days. I like my old K40 better. The antenna is in brand new condition with the original box and receipt from LCR. I paid $60 for the antenna and $15 for shipping. I'll sell it shipping included for $65 or best offer. Thanks.

Ben:
I see what you see, but deeper. What your post should of said is "Communism & Hams." The 6th plank of the Commie manifesto says "Govt. control of Communication & transportation." This was put in here in '33. We had Hams and radio since 1920 or before. What was the difference? Then people were more moral, and lived by more Biblical laws & precepts. Now you have the Humanist religion that says there is NO absolutes, so we need the candy man now to bust the immoral CB power mongers that would dare create tvi over the TV's immoral filth! The Commies are in control of Hollywood, and if a free individual through his CB wants to JAM their TV trash, the commie police will stop their tvi efforts! Socialism IS THEFT and a violation of GOD's LAWS. Only a Virtuous people can keep the Constitution, so if you ain't then the pinko radio police will bust you for your American tvi efforts to jam Hollywood's trash!!!!!
Dave!!!!!!

Hey Charles, like your web page.
Let me spell it out for you a little better.

Socialism: Social organization (FCC)
based on government control (licensing requirement) of the production (use) and distribution (allocation) of goods (band width).
Do you see the relationship now?

Jeff Pierce wrote in message <39773448.FA9D4E0A@preferred.com>...
This would also apply to commercial users, taxi cabs, wreckers,
plumbers, any NON-emergency radios.

Also, the Councilman then implies that a one handed/armed person CANNOT
operate a vehicle.

The point is not having you attention on driving. Such as dialing a cell
phone, writing on one of those dashboard notepads while talking and
driving. It isn't just cell phones, I drive a lot on the interstate and
see a lot of drivers READING while driving. You can actually spot them
ahead of you. They slowly drift out of lane and then suddenly kerk back
into their lane. Plus it is a perfect time interval between jerks. They
have a built in timer but are totally oblivious to what is around them.

This is why I am totally againest the new viewable navigation and
internet devices as they presently are. If you have these devices, they
should not be viewable by the driver, If they are driver viwable, they
should be inoperable while the vehicle is in gear/moving.

I also wonder hao many hams are quilty of having their attention
deverted while changing frequency or using a phone patch.

Plus, think of all the possible accidents as a driver suddenly attempts
to cut across a couple of lanes of traffic to get on the shoulder to
quickly answer an incoming call.

BenDowers wrote:
>
Tradition and the preservation of egoes of a
> few, are not a just reasons to maintain such restricting laws. Laws that
> restrict the advancement of the hobby.

BD,

Please clarify the above. I am trying to tread lightly, because nothing I say here is intended to insult or put down anybody. First of all, I see nothing in the laws as they exist now that "restrict" the advancement of the (radio) hobby. If you are speaking strictly in respect to CB radio and the restrictions that now exist, first of all, CB was NEVER meant to BE a hobby to start with. Second, the laws DON'T restrict the advancement of the hobby in general taking into consideration the purpose of CB radio as it was originally envisioned. The laws were/are crafted to give the individual the option of expanding into other venues which give greater leeway in what can be done. That venue (one of them, at least), is The Amateur Service. Unfortunately, you have this vendetta against that service, or it appears so, that prevents you from taking advantage of it!

What you REALLY want, according to the impression you give with your posts, is an anarchic approach to the radio spectrum. An environment with no restrictions whatsoever. An environment where anyone could talk anywhere from O MHZ to 1000 GHZ without regard to the legitimate need or rights of others. In such a case, the only people with "rights" to radio spectrum would be the MEGA-amp guys, a situation where the only purpose would be to prove their Manhood/Womanhood by walking over every other person who attempts to use a radio.

The reason for the laws is to provide for the orderly and effective use of spectrum by everyone with a demonstrated need. There is a place for everything: military, government, cellphones, commom carrier business, small business, and hobby communications. Certain segments of spectrum are "divided" up and assigned to various services, and this is specifically designed to prevent "turf wars", if you will, and frequencies made useless by unbridled, untrained users.

It is true that Amateur Radio occupies quite a bit of spectrum as opposed to CB which only has one segment of bandwidth. We both know that early efforts to invent, improve, and use radio were by Amateurs. Even Marconi was a "ham" if you define his passion for getting signals out over the air, learning why radio waves do what they do, and tinkering to improve the equipment. Amateur Radio is recognized as a major part of the advancement of radio--maybe it's not by hostile CBers. LOL! Many

radio inventions were the result of early hams' experiments.

The next thing is that the environment which you subtly wish existed now, has already happened! Prior to 1933-34, there were no restrictions on radio stations, and people were putting transmitters on the air as fast as they could. The result was a chaotic mish mash that jammed frequencies and resulted in RF bedlam. Hence the Congress passed the Communications Act of 1934 which also created the Federal Comminications Commission. It is easy to say, well, the things that happened in 1934 aren't relevant to 2000. We often have a tendency to try to discard things just because they are "old". Truth is, age isn't always a determining factor as to the relevancy of a particular principle. It is also true that the factors that govern the ability to use radio HAVE NOT changed: atmospherics, solar events, the ability of a frequency to support a given amount of usage. It's like a dam over a river. The river can flow a certain amount of water. If the dam breaks, the water is almost certain to overflow the banks creating a disaster! Put too many people on a band of frequencies, and it will create a disaster. Allow people to just do any way they want as regards radio, it will create a different disaster.

You and I don't agree at all on this subject, that's evident. Further, you think you are right; I think I'M right. I am convinced that the system of laws, at least in the area of Communications, we have is fair and equitable to all. It allows for ALL people to use radio in some form whether it be business or hobby. CB radio was created NOT to be a hobby--it has been made that way (I'm not trying to debate anyone over this issue), and in the earlier years when the requirements for a ham license was tougher and the morse code requirements were stricter, I can see why many average folks elected not to get a ham license. I know, some hams called it "laziness", or "dumbness" (couldn't pass the test it they tried), or just didn't care about the law. Whatever. But those restrictions have been eased. FACT. The morse requirement has been reduced (incidentally, FCC has been and is following the World Radio Conference, and if it were strictly up to them, there wouldn't BE a code requirement for HF in the USA). There isn't really any impediment to someone who wants to obtain some class of ham license. And, NO, all hams are NOT buttholes--no more than CBers. Hams and CBers are people, and where there are people, there are a few bad apples. So that isn't an excuse.

Ben Dowers, you just seem to be jealous, for what reason, I can't tell. You seem to resent hams just because they have more legal privileges than CB (and, again there are reasons for that). Don't resent it until you TRY it. I betcha you'll find lots of reasons to enjoy it, if you'll give it a chance.

Get used to this...
This is the main reason I hate the SSB mode. It's so damn freqency
sensitive.
Trying to get a group of people together on the same frequency for SSB
talking is nearly impossible! If it's not operator inexperience... it's the
internal oscillator drifting... or both.

What is the proper way to install an amp? In proper I mean what gauge wire, straight to the battery, etc>..? I was thinking of running the amp to a 30 amp relay, and the relay directly to the battery so the amp shuts on and off when I start and shut off the vehicle. I was also thinking of using 10 gauge wire. Does this sound good so far? The only thing I get worried about is that when I'm on the highway and and the alternator is putting out all those amps and volts if the 10 gauge will handle all that current. Thanks. P.S., the amp is a Palomar 250. Thanks.

>I'm mainly interested in the echo mics and
>speech-processing mics. Which ones are best with AM and which are best for
>SSB?

The Astatic "Echomax 2000" has had numerous positive reviews from C.Bers, BUT If you want a truly good mic for AM, Nothing beats the reliable D104SE (Silver Eagle) If you choose the D104...you can buy yourself an additional SSB head for it and you'd be covered for both AM/SSB, I think this combo would be the best scenario. Be warned though.....It wont be cheap, depending on where you buy it.....It could set you back approx $120.00-$135.00. Wish you luck, Regards, Frank.

3444. Re: Socialism and Hams

Jerry, I think he knows better. His real mission was to try to insult hams (maybe for his ego lift) and try to stimulate a hate and discontent thread...that's where he gets his Bennie Boy nickname, he rather immature. Most people realize that socialism is a political philosophy. It's main intent is to redistribute wealth among the have nots or as they put it, level the playing field. Elimination of capitalism goes along with it. History buffs are well familiar with effects of socialism...it has never worked...anywhere at anytime. Government regulation of the radio spectrum has absolutly nothing to do with socialism. How he gets hams being socialists is beyond me...therefore, other motives are his intent or he really is just plain stupid. I guess he feels that hams are all goody goodys who abide by the FCC. All one has to do is sit and listen for an hour or less to know this is not true. Ben, you really need to put up or shut up...where's your proof that hams are try redistribute wealth, eliminate capitalism or even trying to infringe on his rights to operate his radio? I wonder what good 'ol Barry Goldwater would have said to Bennie Boy? JP

Lets see, to start with that amp only pulls about 40 amps wide open.
i have used a similar 250 amp with great sucess using #8 stranded wire got it at Home Depot. I have used a relay also, but it is a waste of time and effort.go straight to the battery.and use the on/off switch on the amp.i mounted mine over head in the console. put a little 12 volt fan radio shack mounted to heat sink and switched thru the on/off switch on amp. kept it nice and cool.
chris

Old farts and now those Useless Young Urban Professionals (Upppees) that want a low tech way to unwind in their new found code hobby (I read about this in the Wall St. Journal). Many young rich geeks in Code now--it has made a comeback big time--maybe even will hit the CB band some day!!!! Is there really something better than a Penatrator 500 ? How much is it & where available today--is it a ground plane? E mail me before Hillary gets in to take them away, or gore may!!!!!
Dave

Jay in the Mojave wrote in message <39788A2A.E7AADF2F@qnet.com>...
Hello blutarsky: Is ok G.I. but photatoe and toielet tube puts out very little. Only old farts on moress code.

Use New Design Mastodon 5000 Ground Plane Antenna (is more bullet proof than Penetrator 500) has much low loss impedance matching device. Not windings around toilet bowl.

Got 2510 radio, and oldey but goodey Pride DX-300, with 4CX350 tube, talk to all local and dx type of guys on cB.

Listen to Rock & Rol musick, live out in Mojave Desert (is real hot now) drink cheap rot gut beer, and VO wiskeyy. Have many friends come by Mojave Desert shack, and see home on the antenna range, drink mass quantities of cold beer in hot desert, and BBQ up mOjave Desert rabits and crows, got big cat that catches them. Is slide on down to desert pull cork and tell lies. Go to Mojave down towN bar and shot pool, and listen 2 T-Bone Sally, & drink mass quanties of store bought beer. Hop train in Mojave train yard, and hop off in next 12 miles, hope train goes slow, if goes fast end up in Bakersfield, ol lady get mad if have to go 2 bAkersfield to go get.

nExt year we is ah gettin a telegraph, will half to do code morese.

We listen and ah monitoor 12 AM, and 38 LSB in vast desert, is call for J
If Mojave dEsert Don comes on 12 radio, tell em U is here to fix Bongo Bob's still.

I know nobody will change your mine Mr. Leland Scott, just like the drunk
who
thinks he does not have a problem. You will go to your grave and never
understanding why these laws are very dangerous to our basic freedoms. I am
not
going to continue wasting my time to explain it to you. The URL's for the
studies supporting the view that mobile cell phone use is dangerous are
UTTER
BULL SHIT and mean NOTHING. Hell more people die every day just because they
wake up and get out of bed, than those hurt because of a cell phone. Maybe
they
ought to pass a law to make it illegal to get out of bed. What you don't
understand is, it's all about money. Insurance money. Wreck your car, cell
phone in your possession, a ticket will be given, insurance won't pay until
you
prove other wise. If you disagree with the conclusions, that's your problem.
And yes I do have the balls to identify who I really am,
and I'm not afraid to take the heat for my views.

>

You have never meet Dr. KAVORKIAN, but my ex-wife did, several times, when she worked at the Oakland County Jail. And for the record he did most of his "volunteers" using Carbon Monoxide, after the Oakland Country Prosecutor took away his first "suicide machine", which used lethal injection. Kavorkian was a man who strongly believed in what he was doing was right, and had the balls to go to jail for life to prove it. You on the other hand don't even have to balls to sign your name.

Of course she is the "ex-wife" because she has a little problem with the booze. Took her over 20 years to finally break her denial and admit she had a drinking problem. How long is it going to take you to break your denial? Or at least be a man and sign your name, and call sign if you really have one. Oh, maybe your not a man, humm......

Sounds like Socialism to me. People like you Mr. Scott, believe that the
above
is a common sense, intelligent, solution to lifes ills. What you fail to
see
is the slow but sure chipping away of our freedom. Society doesn't need to
be
protected. Our individual rights do. Keep it simple. Hold a driver
responsible
his or hers actions. Don't pass laws that chip away at our freedom.

Geekcb,
The way you described will peobably work as well as any. I would suggest using a larger size cable going to the battery. #10 may work okay, but there's always something you'll want to add later. I'd recomend #6, or some times even larger. 'Too big' won't hurt you, too small will.

On that amp10ga wire will work just fine . just make sure to run it straight
to the battery (BOTH POSITIVE AND NEGATIVE) then for good measure run a
small ground from the chassis ground of the amp to chassis ground of the
car.
You can get a fuse block from almost any auto parts store install it in line
with the amp and run 2- 30 amp fuses .
I don't know what type of ant Your going to run but make sure it's grounded
to the frame for best performance of this amp
73 and good luck

THE COBRA -148 -GTL- [UNMODIFIED]-,made in Philippines, JUNE of 1989 on
tag on back of radio, look's a 8.5 to 9 has some ware on front,
covers
look like new,hand mic ,copy of book, pwr.cord, mounting bracket
and thumb screws . ASKING$125+ shipping in THE USA .Maybe trade towards
HR- 2510-HR- 2600 with chipswitch or maybe LINCOLN . TNX RON

3471. FS: Grant XL w/ all the extras

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: kg4fdr <kg4fdr@mindspring.com>
Message-ID: <8lgbjd$dn2$1@nntp9.atl.mindspring.net>
Source record: 45451

For Sale:
One near mint President Grant XL CB Radio. Radio has the following
modification done by a professional:

1- 10 turn clarifier with transmit unlocked (professional looking)
2- 80 Channels above 40
3- 40 Channels below 40
4- Peaked for maximum output and modulation. Sounds loud and strong.
5- Frequency alignment with a professional meter.

All modification are professional and neat. The rig is almost brand new
with hardly even the smallest scratch anywhere. Complete with factory mic,
mounting bracket and power cord.
Nothing but good audio reports on this rig. Receives great also.
Asking $130 shipped anywhere in the USA.
Thanks,
Mark

KRS,

Remember the conversation with you, Prime Minister and myself at Hot Springs.

Remember Prime telling you about his antenna?

Get yourself a MONSTER boom, and I will send you a Yagi optimization utility

For a 8 element yagi, you need about 55 feet of boom.

Dont care about the front to back and front to side.

You want maximum forward gain in the game we play, and maximum forward gain occurs 9 out of 10 times with horrible front to back.

Toll Free

Because in high level modulation, and the design of the transmitter, you need to modulate the driver and final to get acceptable linearity from the amplifier chain. If you modulate just the final, you will get shit audio, and modulating the driver only, you need to run the final in Class AB to get decent harmonic rejection and output.

Hope this helps. Lou Franklin's Understanding and Repairing CB Radios goes in depth on the subject, and is required reading for anyone who hopes to understand.

Yeah and this is just another attempt to sell that Anarchist Cook Book that is floating around the net everywhere by the Jolly Roger. Half of the shit either doesn't work, can get you killed, is hard to obtain and is just way out there. The phreaking box plans are mostly outdated since phone systems have changed a lot since that thing was written and the computer stuff, well go read some of the subjects in there. I remember having this when I was 14 or so, thought it was da shit. Well, you learn otherwise once you stop believing what you read.

I would use 8 gauge if the run is 20 feet, and if it is only 5 to 10 feet, you probably could get by with 10 guage.

Most dashes are fastened on each side with a large bolt, the ones that I used
take a #10 socket, that would be a good place for a ground.

If you still want to disconnect power to amp when vehicle is shut off, the large relay is the way to go, placed right after the fuse close to the battery.
Some vehicles use a starting relay attached real close to the battery, that point
will give you a longer lasting connection without corroding from the battery acid.

As mentioned in other posts, if the amp is in a confined space, put a fan on it.

I run one behind the seat in my pickup for quite awhile. Worked great, couldn't be seen, and I could get at the on/off and preamp switches.

The problem with the grounding rods that they use, and then "tie into" the AC ground is that most amateur and CB ops have NO CLUE as to the need for surface area of the conductors used.

00 gauge wire will vaporize in a lightning contact, making your "tied together" grounds totally useless.

If you really want to do it right, you do one of two things:

1. Get a separate mains drop for your station. Most of the guys running tubes with handles or multiple smaller pieces of steel do this

2. Run your smaller station off a good isolation transformer, and run a GFI in the shack.

Put a GFI breaker inline with the radio room AC service

Run your stuff off an isolation transformer.

Problems solved.

Forgot to mention, they make a maxi fuse that goes up to 60 amp and has 4
guage pigtails on it. If you cannot find it localy, check www.mcm.com

Not really.

6146W is the best :) And I have always had good luck with Sylvania.

(Damn these boatanchors are getting expensive to operate)

So you mean my 350 watt carrier and 3Kw PEP values are a little out of wack Bill? hehe

I can't wait to put my modulator into this steel box I got. 400 watts of carrier, close to 12Kw PEP should be the expected output.

Hope to make it back to the bay again, with more time.

Toll Free

For max noise suppression, quitest rx and best chance of TX output, I would
connect mine straight to the battery.

The fusebox installation method is usually reserves for the "side of the
truckstop" cb shops, in a hurry to do the install, and are NO BETTER than
the cig plug radios.

As for the truckers, Yes, alot

3489. Re: Wilson 1000 Magnet Mount

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: IBM233@webtv.net
Message-ID: <5390-397BBD4C-43@storefull-211.iap.bryant.webtv.net>
Source record: 45469

I like the K40 better because its more user friendly than I found the Wilson to be. My cars roof is curved and the K40 has an adjustment for proper vertical polarization. I can also take the magnet mount off the K40 and use it as a trunk mount. If I wanted to do that with the Wilson magnet mount I'd have to buy a whole new trunk mount/coax assembly. In the performance area the K40 received a little better and had a lower SWR over more frequencies. The Wilson did however beat the old K40 (by 1.5 S units) in getting my signal out. Don't get me wrong, the Wilson 1000 is a good antenna. I just like my old wind battered K40 a little better. Lastly, my new selling price is $60 and I'll ship it for free!!!

3491. Mobile CB Receive Static

Newsgroup: rec.radio.cb
Date: 2000-07-23 00:00:00 UTC
From: TRB <trbrookNOSPAM@attglobal.net>
Message-ID: <397be34b_3@news3.prserv.net>
Source record: 45471

I have a Cobra 75WX ST in a '99 Jeep Wrangle. I get moderate static when engine is running. The static does not change with engine RPM. The spark plug wires are stock and say something about "electronic supression", so I'm guessing their good quality and not causing the problem. Antenna ground checks out fine. SWR is fine.

Things I've tried to no avail:

1) Ran coax completely outside of Jeep.
2) Ran dedicated pos and neg leads to battery.
3) Took receiver unit and mic out of jeep. Ran pos and neg leads direct to battery.
4) Took coax, antena, receiver and mic out of Jeep. Hooked up power and ground leads for receiver direct to battery and ground for antena. Still got engine static.
5) The only thing that stops the engine static is to power the CB with a couple 6 volt lantern batteries. Obviously not a long term solution - but this must be a clue.

How can I run off normal battery AND eliminate noise?

Remove NOSPAM to reply.

3495. Re: 10 watts from stock radio

Newsgroup: rec.radio.cb
Date: 2000-07-24 00:00:00 UTC
From: Michael Champion <mikec@n7uic.net>
Message-ID: <jPMe5.12982$o71.852605@bgtnsc04-news.ops.worldnet.att.net>
Source record: 45475

Now this is where I get lost if you modulate the driver stage and the final is an amplifier then why does the audio power matter at all. 7watts for a 1 watt driver seems to me to be plenty. Do I have to have a 50 watt audio amp to use my cheapy 2-pill? NOPE!!!

Toll Free <tollfree@bigradios.com> wrote in message news:nl9e5.358044$MB.5690595@news6.giganews.com...
Your math works,

However, most modern radio chassis have a 7 watt audio transistor, enabling them to achieve 100 percent modulation of a 14 watt carrier, in theory.

In actuality, they can go 10 to 12 watts and still maintain 100 percent modulation.

YMMV.

The local police here used VHF about 10 years ago and I could completely desense them with 100 watts. They would just tell me to turn my radio off until they were done writting me my ticket :)

JJ475171 <jj475171@aol.com> wrote in message news:20000723184157.09523.00000144@ng-ff1.aol.com...

The "Average" policeman/woman, would'nt have a clue as to the differences between an "FCC"....."Type Accepted" radio or your average "Export" radio, (At
least not the ones in my city)...which is approx 71,000 populus. So....I would
NOT loose any sleep over it, unless your BADLY, and BLATENTLY interferring with
an "Emergency" communications service....ie: "Hospitals" "Ambulances" "Police
Dept" "Rescue" "Airport" "Marine" "Ham" and in extreme casess like a "Church"
other than that, I think you'd be pretty safe just running an "Export" rig.......(Without an amplifier). Regards, Frank.

Thanks very much for you info. Antenna Man called my house tonight and told me that he is sending out a Postal Moeny order for my 460.00. So it is a wait and see thing. I WILL let everyone know including calling Grag and informing him on how it well it went!! :) If I do get my refund then I am sure it is a different person here....

Thanks for keeping me abreast of things...

From: mystique224@home.com
Message-ID: <397BB528.D62DDF0@home.com>
Source record: 45481

I have the following items for sale. All items are in good to excellent condition and are only being sold because they are used very infrequently. Pics can be sent via email if requested. Please use my email address to reply.
Thanks,
James

1 - Bird 100-250MHz 50W Slug (Used) - $20
1 - Bird 200-500MHz 10W Slug (Used) - $20
1 - Bird 200-500MHz 50W Slug (New) - $40
(Will take all three for $75 plus S&H)

1 - Emco DMC-1 Capacitance meter - $25

1 - HP 403B Voltmeter - $75 (beats $400 for a used one out of about any used test equipment dealer)

1 - 3CX800A7 Power Triode tube (New) - $300

I am also willing to trade, just send your offers. Would like to find a decent HF rig or maybe some other test equipment.

S&H will be $5 for any individual item and will be 2-3 day priority mail. Items will be guaranteed not DOA and in working order, but only if insurance is included in the shipping. Which only makes it about a $1 or 2 more anyway. Obviously any items, like the slugs, will be shipped for just the one S&H fee if they are requested by one buyer.

>> version of the popular "screwdriver" antenna as a hobby and sell them
>> at hamfests and upon request. You'd think an Extra Class ham would
>> more than know how to install and resonate ANY HF antenna. NOT! ....

Your use of "any" is synonymous with "every" in this case.

My reply stands:

That's too big of an assumption. Expecting an Extra (or any other
amateur [i.e., non-professional]) to have knowledge of *every* HF
antenna ever designed is asking quite a bit.

>fact remains that, as the requirements have lessened, the tests have
>gotten easier, the less "learning" occurs.

As before, the amateur test is an entrance exam, not a final exam.

I have the following for sale:

1) White Wilson 1000 magnet mount antenna. New condition, used 2 days. Bought from Coax Kid 3 weeks old. Box and original receipt included. Asking $60 shipped.

2) Midland 79-290 AM/SSB/WX mobile. One year old from Bills2Way. Frequency and power mod done, 6 bands plus 10 meters and weather, 30 watts PEP on SSB. Midland power mic. Detachable control panel face. Original Midland boxes and paperwork included. $130 shipped.

Will trade the 79-290 and the Wilson 1000 for a like new condition modified Eagle Tomahawk, ProStar, etc Base Station.

3) Uniden PRO810e AM/SSB Base Station. 10 years old, purchased from Copper Electronics. 99% operating condition. The 1% is a couple of LEDs in channel display are out. Unmodified 40 channel AM/Sideband radio. Works great! Original Uniden box included. $100 or best offer shipped.

If you have any questions feel free to e-mail me.

VHF low is 30 to 54 MHz. VHF high is 136 to 174 MHz. (scanners)

My local cops used to be on 39 MHz. The fire dept. was on 46 MHz.
I could key up near a firetruck and hear bleedover. Only did it
once and it was an accident. I'm sure the cops would hear me if
I was close. Now they're 800 MHz trunked and it's easier to listen
to them.

Fizz,
If you make the dipole 34.4 feet long, it's going to be resonant
around
13 Mhz. No, it won't be resonant on CB (27 Mhz).
If you run one leg horizontal, and the other leg vertically, it
doesn't
change the polarization at all. It will change the input impedance,
and
it will make the SWR go up.

TRB,
Sounds like you may have a noisy fuel pump. If you can get to it,
by-pass it with a ceramic capacitor. Maybe about a 0.01 at about 35
to 50 volts.

> power, the mic end of the equation is the
> wrong place to be. The other end (RF amp and
> antenna end) is where the big improvements
> happen.
If you have the opportunity to listen to a 'correctly' set-up Datong
'RF' speech processor you may change the wording of the above statement.

Of course what you say about amp and antenna also holds true.

Regards

Phil / UK

Hang on here just a minute. Perhaps there has been some misunderstandings. When someone says that you should ground the radio, they aren't talking about the third wire going into the wall plug. Ground the CHASSIS to the separate ground.

That is my Texas Star Sweet Sixteen.

It does around 300 to 350 carrier, and will put a thousand watt slug in the
corner.

>
> > I can't wait to put my modulator into this steel box I got. 400 watts
of

> you'll sound pretty bad.

You know, that is the textbook definition.

Clip the negative portion of the waveform, and you fix that problem.

However, you still get the distortion related to AF clipping, though.

Is that ratio based on personal
> choice or by necessity because of some design limitation
> that prevents the generation of a reliable, low distortion
> carrier in the 1.2 to 2K range while still being able to
> achieve 12K peaks?

That is because the driver I currently have to get the PEP values up is only
a Texas Star Modulator +.

I can also run a 12Kw carrier out of the amp with no problem, however, it
does drop on the AVG side.

It is capable of holding a 8 Kw carrier, mebbe more, if I had the line input
to do it... The mains sag is what is killing me so far.

4CX5000A is the tube.

If it's by choice, I'd reconsider
> exceeding 10:1 unless you're manipulating the modulation
> envelope.

Read way above, and you will see I am doing just that with a clipper and "modulator" I also RARELY, if ever, feed my modulator more than about 120 percent modulated RF signal... Keeps the "shit sound" off the air.

>
> > Hope to make it back to the bay again, with more time.
>

Hello Major Tom: Good advice here. I simply assumed that everyone's house had a ground rod, which as you pointed out could be a big problem.

My neighbor and my power drop come from the same power transformer, we are wired in parallel, so if he didn't have a good ground, My ground rod would half to take up the slack.

So care should be taken to eliminate a ground loop when a additional ground is added for the radio equipment.

Good advice on the trouble shooting and fix.

Jay in the Mojave

here is a link to the 10-code, I agree with Gary though, plain language is much better, in all the years of operating radio here, I can honestly say the only 10 codes i've used is 10-9, and 10-8, and those were used mostly in a sarcastic/joking manner.....

KW

Mark,
I think an outside antenna would do more for you than higher
power. That assumes that you stay with in sight of the rest of
your group. Since it isn't permanent, a 'Rat-Shack' mag-mount
ought to work okay for you (or other 'cheapy' mag-mount).

Actually the mag mount is a pretty decent choice, not everyone wants to drill holes in there vans, If you don't mind the holes the Wilson 1000 or 5000 can be purchased as a roof mount... The 102 whip will perform better than the Wilsons, however again, not everyone wants or can mount 8 foot + antenna on the vehicle roof. A GOOD mag mount won't wear a spot in your roof, if you are carefull when installing/removing the antenna, and DON'T slide it you won't even scratch the paint... One bad thing about a magnet mount is they seem to collect all forms of debri, you would also need to make sure the magnet remains free of ANY foreign material.. if you live in the salt belt, an occasio0nal removal to clean salt is needed, otherwise you can basically leave it alone.... I have no idea what mag-mount hamm4fun used, and had wear a hole in his roof, but it was either a real cheapie or installed/removed a whole lot without a lot of care... I've used magnetic mount antennas without any problems on, and, off for many years... As to performance, yes you can find a few antennas that will perform better than the Wilson, however typically they cost more and are not as easy to install... Unless you really know your antennas, your better off to get a Wilson, they are easy to install, and tune, plus you can find them just about anywhere that sells radios (other than Radio Shack).. Wilsons will also provide a "NO SURPRISES" purchase and install..... If you buy it from a regular CB dealer and not a Truck-Stop you should even be able to get them to tune the antenna free.....

KW

Use the formula 468 / freq = 1/2 wave dipole
example 468 \ 27.205 = 17.227 feet
Use the formula 1005 / freq = full wave loop. (quad)
the quad can be circle, square, diamond, triangle, as long as it is a full loop. the feed point of the quad should be on the side for vertical polarization and on the bottom for horizontal. If you lay the wire flat, it will be horizontal polarized.

borth can be fed directly with coax, but either a 4:1 or 1:1 balun is recomended to help with feed point impedence matching to 50 ohm.

I have been expericncing lots of static noise from my dipole. I do not have a 4:1 balun on my dipole, and believe that if I did, I wouldn't have the static (power line noise).

I had a different kind of wire antenna up and it didn't have 1/2 the noise on it. I am putting up the first antenna again.

Hello Gary: Saying and talking 10 codes are plain language on CB.

I use em on the local 2 meter repeater also, this usally fires up a few of the boys. Espically if you use the Ten codes wrong.

Example: "This is KF6***, calling Kf6$$$ do you have a Big Ten-4?"

"Break KF6***, please do not use Ten Codes on this repeater, this is W6%^&"

"W6&*$, Big Ten 4, hay was that your ol lady hanging off ya in the welfare line today, I was just in back of ya a few dudes worth, Ten-4"

..... static .....

"Heah W6@#$ where did ya ah go dude?, Ten-4"

"This is KF6*** Ten Over n Out"

Some guys just don't have a sense of humor, ah?

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

BUT, if you multiply 468 x 2= 936 which then will equal somewhere, divided by the freq in mhz, around 34 feet. IIRC, you can use 234 to find a shorter antenna length so why can't you multiply the 468 and get a resonant length that way? I have a very limited knowledge of antennas beyond dipoles......

We just threw out about 3 pallets of GE Master Pro Low band tube final radios, they came from a power company. Had them for about 4 years, sold about 80 of them the first 6 months and the other 60 or so sat around collecting dust. They went to the scrap. I think that they had 807's or something similar. I kept one or 2 thinking about making a 6 meter repeater or something. Another project....

i have a handheld cobra CB that works pretty good at short ranges (probably up to a mile). it comes with a 12v adapter and plugs into the lighter or it uses AA batteries. i gave $80 bucks for it at best buy.

walmart carries a cheaper version made by maxon and i think it goes for around $35. cobra is a better brand but it may not be worth the extra money depending how much you intend to use it.

for the relatively low price of the handheld CB i recommend it over the "walkie talkie" radios. you will be able to listen to the other CB channels (the most used CB channel is 19) and you can get some interesting tips from the truckers about the location of speed traps or traffic jams. when you want to carry on a private conversation just switch channels.

regardless of the brand name or radio type i recommend testing it to make sure it does what you want. keep your receipt and you should be able to take it back if you don't like it.

I agree, I have a 5 watt handheld, and get about 10 miles to the repeater with the rubber duck. When I use a 5/8 wave magmount, I get to about 25 miles.

I was just quoting out of an antenna handbook, it say to use the 1005 formula for quads.

If you are going to make a dipole, stick with the 468 formula, it will work. Longer antennas require different feedpoint matching for direct hookup to a 50 ohm coax/transmitter.

As always, that will get you close, they all require field tuning depending on the installation application. Cut your wire lengths to allow a little adjustment.

Good Luck

OK, what would be the best to use for communications between 10 - 20 miles, MOBILE to MOBILE? CB or commercial low band equipment, 40 - 50 mhz. I realize the lower the frequency, the more range you get, but what would be the best to use, thanks in advance.....

Geekcb wrote:
>
> What is the proper way to install an amp? In proper I mean what gauge wire,

For a 250, 10 guage.

> straight to the battery, etc>..?

Go to the ends of the battery cables opposite the battery.
For positive it will likely be the starter solenoid. For
negative it will likely be the engine block. Using the
opposite ends of the battery cables prevents corrosion and
usually shortens the wire runs.

> I was thinking of running the amp to a 30 amp
> relay, and the relay directly to the battery so the amp shuts on and off when I
> start and shut off the vehicle.

Good idea. A dash switch in the relay control wire is
nice too. That allows you to cut the power to the amp
even if the ignition switch is in the on or accessory
position.

The on/off switch on the amp does not control the DC
to the power transistors--it only controls the power
to the transmit relay. So, it's always a good idea
to be able to cut the power to the amp when you're
away from the vehicle.

> I was also thinking of using 10 gauge wire.

Good choice. Use good quality wire. More thin strands
are better than fewer thick strands.

> Does this sound good so far?

Good.

> The only thing I get worried about is that when
> I'm on the highway and and the alternator is putting out all those amps and
> volts if the 10 gauge will handle all that current.

The current through the wire is related to the load
not the output of the alternator. In other words,
the amp controls what goes through the wire. 10
guage is plenty for that amp.

> Thanks. P.S., the amp is a
> Palomar 250. Thanks.

Good luck and have fun.

I have the following for sale:

1) White Wilson 1000 magnet mount antenna. New condition, used 2
days. Bought from Coax Kid 3 weeks old. Box and original
receipt included. Asking $60 shipped.

White Wilson 1000 mag mount for $60 used???? Damn that's high.

3566. Re: tuning dual antennas

Newsgroup: rec.radio.cb
Date: 2000-07-24 00:00:00 UTC
From: Mike Yetsko <joe@user.com>
Message-ID: <eVYe5.5694$ga2.146013@newsread2.prod.itd.earthlink.net>
Source record: 45617

When tuning dual antennas, use a 50 ohm cable and tune each one
for lowest SWR as a SINGLE antenna. Then when you hook up the
'special harness' made from 75ohm cable, the two antennas will
'appear' at the connector as two 100ohm antennas (transposed by
the 75ohm cable) in parallel, which is 50 ohm.

Hmm, I suppose in a pinch, you COULD disconnect one antenna,
and put a 50ohm resistive dummy load in place of it while you
tune the other antenna, and swap to tune the second antenna....

The 75ohm cable is a VERY specific device of 75ohm cable cut
to a 'specific' length based on the velocity of the cable itself. Do
NOT put any extensions on the individual ends of this harness. If
you HAVE to extend the length of the cable, do so from the radio
to the harness common connector, NOT on the individual ends.

Could you use 100 ohm cable as someone suggested? Well,
yeah, but not without recalculating how to make it transpose
the 50 ohm antenna impedance to 100 ohm, so that the two
legs appear as 100 and 100 in parallel to give you 50 ohm.
Hmm, think of this visual... At certain wavelengths a piece of
cable will 'transpose' an impedance mismatch. That means, that
at a 1/4 wavelength (electrical, not physical. Electrical is the
physical length times the 'velocity' factor (the percent figure you
see in some specs)) a short becomes an open, and an open
becomes a short. This is how stub tuned traps work. And it's
ONLY at a specific frequency (or close). But what about a 'low'
impedance? Well, low becomes high, high becomes low. So that
50Ohm antenna, at a 1/4 'electrical' length from one end of 75ohm
cable to the other, is 'transposed from 'low' to 'high'. In essence,
that 50 ohms becomes close to 100 ohms, for 'each' leg of the cable.
So you see that 100ohm cable just wouldn't work.

Where else could you use this? Well, a dipole is 72ohms at resonance.
You could use 1/4 wavelength of 62 ohm (old ArcNet cable) to
'transpose' that to 50ohm. But in a practical sense, you'd probably
loose more in the hardware trying to do that (and in the crappy
ArcNet cable) than you'd loose just using a single run of good quality
50 ohm cable. But you COULD do it.

As to distance, if you can't get to 102" it's not that big a deal.
Yeah, it will work better, but the big advantage of 'dualies' in most
'practical' installations is just to get better coverage around the
vehicle. Big trailers tend to create big black holes in certain
directions.

(I always laughed when RS sold those 'shorty co-phased antennas
that people used to put 4 feet apart on their trunks!)

Mike

CB amps don't have protection circuits.
So, don't expect much of a warranty--
especially on the power transistors.

> Bill? hehe

Alot of guys say 10:1 is the practical limit and I don't
argue with them. 350 key and 3K PEP is 8.57:1 which is
a little high in my book but okay to many people.

> I can't wait to put my modulator into this steel box I got. 400 watts of
> carrier, close to 12Kw PEP should be the expected output.

400 key 12K PEP is 30:1. If that's symmetrically modulated
there will be so much carrier cut-off time per cycle that
you'll sound pretty bad. Is that ratio based on personal
choice or by necessity because of some design limitation
that prevents the generation of a reliable, low distortion
carrier in the 1.2 to 2K range while still being able to
achieve 12K peaks? If it's by choice, I'd reconsider
exceeding 10:1 unless you're manipulating the modulation
envelope.

> Hope to make it back to the bay again, with more time.

Maybe we'll get together.

Hi Phil.

We're not considering RF processing here.
Also, I did try to word my statement to
include RF processing (since it takes place
at what I think is the "action" end of the
equation).

A friend of mine's dad passed on a few weeks ago and he was going through some of the old Cb equip his dad had. Among these radios and stuff was an old single tube base amp called an EEC mighty mark one. He gave it to me to fool around with since he already has an amp. I am curious as to how old this thing is and who made it. it is not some hackshop special as it looks really nice and has very little show of useage on it. The tube in it is a 6je6a or something like that. Any info?>

>

Seperate ground for radio? yikes!!
Depending on how your house is wired, potential ground loop problem here.
You need to check your house ground situation before adding that ground rod
to your equipment.
If your house has no ground rod (my house was like this), it relies on the
ground
coming in with the power wires from the power pole. If there is a failure
on a nearby pole (tree falling, car hitting pole, dropping wires, etc.), or
a short
occuring in an appliance somewhere in your house or your neighbors house,
the electrons will seek the
shortest path to ground. Those electrons will pass through the ground prong
into your radio (hope you are not using it when it happens) into the chassis
then
through your ground wire from your radio into your ground rod. And if it is
bad enough,
you now have either a dead body next to radio or a house fire. I allready
have had one friend
that lost a part of his house and all his radio equipment due to fire
because of this "ground loop" problem.
This is just one potential senario and there are many that can happen.

One way of detecting a ground loop problem is to measure for current between
the radio equipment
and the ground rod you want to use. Do this with all your radio equiment
turned off.
When I detected the problem here I had several volts and some current
running
through my radio gear continously into that dedicated ground rod. That
current can come from
anywhere in my house or even my neighbors if they have no ground rods
installed in their houses..

Several months ago I spent a few hundred dollars correcting the wiring
situation in my house.
I added 2 ground rods 6 feet apart (the city I live in now requires 2) to
the main circuit breaker.
I added 2 separate dedicated breakers (110 and 220) only to my radio room.
I have a ground wire running from my radio gear to a 3rd ground rod (for the

radio equipment)
then the wire continues to and connects to the main 2 ground rods.

There is some info on this in the Ham Radio ARRL handbook or
in just about any electrical handbook on this ground loop subject.

Sorry for being off the subject matter.
Just trying to prevent another possible tragedy here.
Major Tom

With that kind of antenna you give up about a db of gain for max front to back ratio. For something respectable say 20db front to back you only loose about .5db of forward gain. I've had the monster antenas and did not like them that much.You had to be aimed dead nuts on and you could not notch out noise by putting the backside toward the interference(rarely would the noise be in the opposite direction). But when this is not a problem they are hard to beat. If I had what I wanted though it would be a lot more than one antenna. Something on the line of a Moonraker 4, an 8 element job on a 60 ft boom, a good 5/8ths and a 1-1/4 for working short skip. My wife would kill me though.

Endless, Nameless,
I'm not familiar with that amplifier, but a 6JE6A is just not
a big 'power house' tube. The plate dissipation is about 30 watts
or so, and like most 'sweep tubes' can be pushed a bit on SSB. I
don't think I'd try for more than 30-50 watts on AM, if that much.
Good luck with it, and have fun...
'Doc

I have a Johnson base station forsale, It's 40 channel, has a meter, I will only work on DC, cause the AC gets hot. It keys 2 watts and swings 10 watts, it also comes with a TUG-9 Amplified mic (desktop), This radio is loud and clear, no garble! The modulation has been cut, This a collector and a talker! Let me know if any are interested.

Johnson 4230 Base Station - $65 with $10 shipping

3595. Transmit problem with in-car CB radio

Newsgroup: rec.radio.cb
Date: 2000-07-24 00:00:00 UTC
From: "Mark E. Hansen" <meh@unify.com>
Message-ID: <397CB24D.C9AE9A42@unify.com>
Source record: 45646

I need to stay in communication between multiple vehicles on an interstate drive. I don't want to use cellular phones as they will be out of their service area for most of the trip.

On a previous trip, I used 2-watt walkie talkies. These seemed fine at first, but once we got moving freeway speeds, we were unable to communicate at all. Even when traffic had been stopped on the freeway, we were unable to hear each other unless we stuck the antennas out the windows (and even then reception was terrible).

Would "full power" (I assume this is still 5 watt?) walkie talkies solve this problem?

Do I need to buy under-the-dash CB radios and use externally mounted whip antenna?

Would the magnet mounted antenna work well enough (I probably can't permanently mount a CB antenna, as at least one of the vehicles will be a rental).

Any help would be sincerely appreciated.

Well, I have an antenna dilemma...I can no longer use an outdoor antenna, and have been using a mobile magnet-mount antenna attached to an steel shelf indoors for sometime now, but it just is pathetic. Here is my situation..I live on the 3rd floor of a 3 story house, and I am looking for an antenna or a "system" to hook up either indoors or slightly outdoors (outside window..) Which will give me better performance than what I have...If anyone can share some ideas or theories, I would be grateful. Willing to try almost anything to increase receive and transmit. If anyone can help, please get back to me. Thanks.

John: You might try a Dipole antenna. My brother has the same problem you have and he uses a Dipole antenna and it works great. You can tune the SWR's for very good performance. We live about 3 miles apart and he can reach me with a 4-5 pound carrier. My brother has his mounted about 4 inches from the ceiling with acco push pins. It stretches about 12 feet across the wall or you can go around a corner also. Good luck. Erv

Wilson 1000 is good with wilson mag mount unless you traverse more than the 40ch spectrum. For wider bandwidth look at the Valor "big bubba" (similar to wilson1000, but a few inches longer), using the wilson 1000 mag mount. I've used one of these for years.
Regards,
Woody

Message-ID: <8lki5n$b3j$1@trsvr.tr.unisys.com>
Source record: 45520

Looks like you guys answer these questions a lot, hope you don't mind another.

What is the best antenna for a fiberglass top conversion van? I bought this 1989 Dodge conversion and it has a Uniden Pro 500D installed, but the antenna is a cheap mag mount that the previous owner left on the dashboard when not in use, and on the hood when he used it (the ring left by the antenna is not too bad). Any way is a rain gutter mount a good choice? How about something on the rear bumper?

Thanks,

Steve Pretti

If you are willing to spend a little money, you can toss a random piece of wire out the window and use it with an antenna with a tuner. MFJ makes a little two knob random wire antenna tuner and there are many other ones with built in meters and other controls on them. I am temporarily using this now and get pretty good results out of it.

Yeah, but the average police officer is going to give you crap about it no matter what. Had this problem with a scanner even though there are no laws in my state. The cop thought I was stupid, well most of the time I am not.

3623. Cherokee CBS-1000

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: Unit 115 <jrbradford@erintennessee.com>
Message-ID: <397dd523$0$29411@wodc7nh1.news.uu.net>
Source record: 45524

Does anyone have one of these for sale or know where I can obtain one at a reasonable price? From what I have read in reviews, this is the perfect radio for my purposes (I'm a police officer in Tennessee...looking for a quality radio to put in my car). Any help is appreciated.

Joseph Bradford

P.S. Please do not try to sell me a product if you do not have it. That is called fraud and I'm very well aware of available methods of recourse.

I just got an old MidLand 77-103
does anyone have info on this, like
o power output.
o Channel coverage.
i specifications and manuals.

I'm new to CB and looking for a good place to get
info. links, FAQs etc.

Thanks
Ryan

I understand this antenna has a fold down feature. How functional (easy to use) is it? I frequently park in covered garages and thought this would be a good feature especially for a permanent mount.

The Cherokee CBS 1000 is a base station and I seriously doubt it can handle the movement and vibration that would result if used as a mobile. On top of that, they are junk.

Wrong. Kingston, NY passed ordinance 189 early last year enabling local authorities to enforce what is deemed "acceptable" in the way of citizens band radio. A permit is needed for an antenna and only one antenna per residence is permitted. All complaints to the police regarding cb radio are followed and dealt with almost immediately.

>

It didn't wear a spot in the roof, just through the paint. Often this type of damage is hidden, I know the damage to my paint did not show up until a couple of years after I quit using the mag mount. Then a big gray circle showed up where I had been using it. Yes with a lot of care this will not happen but we are often not this careful and sometimes the antenna can be moved and set down on a dirty spot without you knowing it(strange things happen in parking lots). Drilling a hole these days is no big deal especially on the roof of a van. With

the popularity of cell phones it is expected and often even desired and if done neatly has no effect on the resell value. Also with the hole you will not have coax pinched in the door and draped across the roof where it rubs the paint off. I would never use a mag mount except for a temporary installation. Even the most minimal of touch up painting these days can cost $500 and a lot of today's paint jobs have to be touched up professionally. Its your paint job and you are taking the risk.

Actually the transistors will be strained about the same regardless of whether you use a 4 ohm speaker by itself or the speaker with a resistor in series with it because you will have to crank up the volume to enough to make up for the loss of the resistor. Most "8 ohm" solidstate amps actually have a lower output impedance than 8 ohms and the 4 ohm speaker will work fine without any changes.

I wouldn't go with a mag mount. On a van just go ahead and drill the hole in
the roof. The hole can be easily plugged and the mag mount will wear out a spot
in your paint that is hard to fix. Just about any top or center loaded antenna
5ft or longer will do a pretty decent job. Stay away from any antenna that
claims to be a 5/8ths.

3652. FS: RCI 2970, TX 1200, and other equipment

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: "Mr. Breeze" <mrbreezej@netscape.net>
Message-ID: <397CF2DB.5A67329A@netscape.net>
Source record: 45582

Hello all, I am selling all of my radio and test equipment. Here is
the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB $250
2. One EC 2018 Road Noise Turbo microphone Included with radio
3. One Texas Star 1200 amplifier AM and
SSB $300
4. One Workman 2K Low Pass
filter SOLD
5. One 24VDC 1.5F
capacitor
SOLD
6. Two Radio Shack external
speakers $5 ea
7. One Super Penetrator mobile
antenna $20
8. One 6" spring included with antenna
9. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $20
10. One DAIWA Cross-Needle power/SWR meter 2KW max range $100
11. One Radio Shack 3A power
supply $25
12. One Radio Shack Frequency
counter SOLD
13. One 300 W MFJ 260C dummy
load SOLD
14. One 1.5KW MFJ 264 dummy
load $40
15. One 60A DAIWA power
supply $150
16. Assorted electronic parts in storage drawer
cabinet SOLD

All equipment is like new, REALLY. I take care of my equipment. The
radio and the amp are 6 months old.

If you responded to an earlier for sale note a few months back, I lost
the messages, computer problems. Email a response if interested.
All prices exclude shipping charges. Buyer pays shipping
and money order only sales. I am in the Washington DC area if
interested in seeing before buying.

John

P.S. I also have a 100MHz O'scope that sometimes works and sometimes
doesn't. It looks like a power supply problem that I was too lazy to

fix and now it doesn't really matter. It is a Textronix with all manuals. Make me an offer if interested but it will probably cost more to ship than you may be willing to pay.

3653. Where can I get some 807's

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: hamm4fun@aol.com
Message-ID: <20000724215427.02780.00001877@ng-md1.aol.com>
Source record: 45583

Was cleaning out the barn today and found an old amp I had built years ago, thought it was long gone. It was made from an old GE low band VHF two way used by the GHP and uses a pair of 807's. Every thing seemed to work OK on it but power was about half of what it used to put out. Also found a stereo tube type amp that also uses 807's and a 50 watt modulator some one gave me. It uses 807's also. Can you still get these are should I salvage what I can for parts and scrap the rest.

Source record: 45585

Hi Gary and group:

I have 2 base rigs here, One HF(with ground on plug) the
other VHF/UHF(with no ground on plug). If I put an ohm meter
on the hf rig between the ground prong on the plug and the chassis of the
rig I get a direct short with no resistance. The same with my amp(which is
3prong/220).
Now do you see what can happen?
But on my VHF/UHF rig there is no ground prong on the plug so it would not
make
any difference on that one. If your rig has no ground on the plug (and many
do
not), this ground loop potential is not a problem.
I have also seen equipment with grounded plug but the connection isolated
from the chassis.
It all depends on the equipment.

Jay is right about grounding your chassis. You just have to make sure you do
it right.
I had an electrician friend help me solve this problem and it took him a few
times
to explain and draw out this ground loop problem before a light bulb clicked
on in my head.

I hope I explained it OK. Or did I get you more confused?

> recomended to help with feed point impedence matching to 50 ohm.

You don't want to use a 4:1 balun unless you are feeding a folded dipole which has a feed point impedance of 300 ohms. A 4:1 balun is used to match an impedance difference of 4:1 between the antenna feed point and feedline. If you use it on a halfwave dipole you will get a large mismatch. So a 4:1 balun would not be recommended as you say above.

>
> I have been expericncing lots of static noise from my dipole. I do not have

And you would have a big mismatch.

From: Quique <49mu182@wanadoo.es>
Message-ID: <gHbf5.22$S15.700@m2newsread.uni2.es>
Source record: 45591

I think that's better use movil equipment of VHF or UHF programmed with a private frecuency, and using CTSS codes, with a single magnetic antenna adjusted to this frecuency. Normally this transceiver have 25 watts of power.

The best 73's.

3662. RE: CB or Low Band commercial?

Well, I have an antenna dilemma...I can no longer use an outdoor antenna, and have been using a mobile magnet-mount antenna attached to an steel shelf indoors for sometime now, but it just is pathetic. Here is my situation..I live on the 3rd floor of a 3 story house, and I am looking for an antenna or a "system" to hook up either indoors or slightly outdoors (outside window..) Which will give me better performance than what I have...If anyone can share some ideas or theories, I would be grateful. Willing to try almost anything to increase receive and transmit. If anyone can help, please get back to me. Thanks.

cb radio is NOT vhf. its hf and thats a whole different
ballgame .... cb is 11 meters or 27 mhz. propagation is
totally different. lets compare apples to apples.

dave

by the way, 82 meters isn't vhf either....

3670. Re: Socialism and Hams

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: bendowers@aol.com
Message-ID: <20000725180635.26990.00000095@ng-ce1.aol.com>
Source record: 45650

>Jerry Oxendine joxendi@bellsouth.net said

>Ben Dowers, you just seem to be jealous, for what reason, I can't tell.
>You seem to resent hams just because they have more legal privileges
>than CB (and, again there are reasons for that). Don't resent it until
>you TRY it.

>I betcha you'll find lots of reasons to enjoy it, if you'll
>give it a chance.

You have way to much for me to respond to . So I'll address your last paragraph.
I have no real restrictions. You as a ham have nothing that may be out of my, or anyones else reach. Everything you have acquired, education , experience, equipment, and so on, may already be within my possession, or at least within reach if I desire. Jealousy is not a factor.
Beleive it or not, I hold no resentment toward Hams in general. How ever I do resent what I beleave to be laws based on ,as I said, Tradition and the preservation of egoes, and those who refuse to let go of them. You made reference to chaotic mish mash at a time when there were no restrictions. I'm sure that would happen again. And I'm equally sure that in time, not only would we see more experimentation, and advancement equipment and of the hobby.

3671. TO the group ref: Antenna Man

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: rgray@kc.rr.com
Message-ID: <Rbof5.13690$t%4.110922@typhoon.kc.rr.com>
Source record: 45651

On 6-20-00 I sent "Antenna Man" a money order for the amount of 460.00, for a DX 1600 with fan kit plus a DX 100. I never did get the amp as promised and was sure that I got ripped off. However on 7-21-00 Antenna Man called me via phone and told me that the amp in question was trashed and he wanted to refund my money. If anybody has been following the happening on this and a couple of things I was sure that this was NOT going to happen , but another song and dance like I have heard before rom others. Lo and behold today 7-25-00 I got a money in the amount of 460.00. Surprised me all to hell let me tell ya!!! Not only that but it cost him almost 12 dollars of his money to overnight express it!!!

Ok I belive that ChocalateJay and Antenna man are two different people. HOWEVER they do know each other!!! Antenna man "appears" to live in Franklin LA (that is were he has a PO box) He also goes by Unit 441 Buckshot. If anyone wants some REAL names then email me and I will let you know.

I no longer have a beef with "Antenna Ma" at this point!!!

There are more details that I will not post here however I will send info via email to anyone that asks...

If nothing else came out of this I learned one thing GREED aint good and at 47 a fella would think that I would have known that by now!!!!

(BTW anyone wanna sell a DX1600 to me??? ;))

Now, now Bennie Boy...you certianly are warped. Let's eximine the truths here.
1. Big lie on your part...I see no truth in what you say...didn't I ask you to prove it, which you have not. Didn't I say that you would never be able to?
2. How stupid you are Bennie Boy, not only have I posted my real FULL name but I have posted my address also. I have done this by posting my amateur call. There are numerous sites containing amateur call information. Aren't you the one who only goes by his first name?
3. No, you really don't have my attention, I just want to see just how far you will go. It's getting rather funny now.
4. My second time around licence wasn't hard earned at all, ANOTHER LIE Bennie Boy. As a matter of fact, it was rather easy. I was (second time around) licensed in Sept. 1994, after a 19 year laps, as KE4QXE and made extra in 6 months. Those same data bases will confirm this also. Don't try to accuse me of a handy capped code requirement...that will be just ANOTHER lie on your part. My first license was in 1973, that I let expire.
5. Now your BIGGEST lie of all Bennie Boy...Me, the one who stirs up resentment?! Jesus H. Roosevelt Christ Bennie Boy...just who started this hate filled rhetorical thread anyway? Were you not the one that cast the first stone? Oh yea, I forgot, hams have been depriving your rights and taking money out of your pocket. Actually, this has been the first time I have ever taken part in a rhetorical, baseless, slanderous TROLL thread. I knew it would be easy pickins!
Please, please open your mouth again Bennie Boy, your foot fits rather well! 73 good buddy!

3680. Re: Wilson 1000 and K40

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: kg4fet@aol.com
Message-ID: <20000725184921.29562.00000038@ng-cp1.aol.com>
Source record: 45660

The Wilson requires a 3/4" hole in the roof and has a much wider bandwidth then the K40. You can expect a 1 MHz bandwidth(ie 26.505-27.505) with an SWR below 1.5:1 on the Wilson and maybe 500 htz on the K40. I have run both and swore by the K40 untill I bought my first Wilson 8 years ago and have run nothing else since. I even run one now in 10 meters as a mag mount, and swap the coils out for which ever portion of the band I'm on (ssb or FM).

Well where do I start? You asked me to prove it?? Prove what? Do you want me to prove my on opions? Ok , how do I prove my own personal opions are my opions? Exaimme the truths you say? Ok. First you accuse me of lying. Then you insult me by calling me stupid.You claim I don't have your attention, yet you can't help , but respond. You feel compelled to prove yourself, by providing your resume as a ham. And excuse yourself , for this is after all, as you say, your first time to respond to such a thread. You my freind just need to let it go. I know I stated some things that hit home, and obviously bother a great deal. But you need to chill out, take your med's, and go on with life.

73's to you GOOD BUDDY

3689. Florida Man Arrested for Interference

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <397E31D8.64CC@bellsouth.net>
Source record: 45669

The following is a bulletin concerning interference and unlicensed operation. This fellow's CB handle is "Rabbit Ears" and he has run afoul of the law before. Nothing should be inferred by the posting of this--it's just news about happenings in the radio world. No flames are intended, nor is it posted to start an argument between CB and Ham operatiors. It is just information, no more.

Best 73 to all,

Jerry

QST de W1AW
ARRL Bulletin 31 ARLB031
From ARRL Headquarters
Newington CT July 25, 2000
To all radio amateurs

SB QST ARL ARLB031
ARLB031 Florida man arrested for interference to
hams, unlicensed
operation

Federal authorities have arrested a Florida man and charged him with interfering with Amateur Radio operations and transmitting without a license. William Flippo of Jupiter was taken into custody July 20.

Flippo already faces a $20,000 fine levied last summer for unlicensed operation, willful and malicious interference to Amateur Radio communications, and failure to let the FCC inspect his radio equipment. The matter was referred to the US Attorney in January after Flippo failed to pay the fine, and the interference complaints continued.

Armed with a search warrant, federal marshals and FCC and FBI agents, accompanied by local authorities, took Flippo into custody. FCC agents seized items related to the alleged offenses, including radio equipment.

Flippo was released on a $100,000 bond. An arraignment on the federal charges is scheduled for July 31. One condition of his release is that he not make any radio transmissions.

Flippo was charged with four counts of transmitting without a license--each count carrying a maximum

penalty of one year in prison and a $10,000 fine--and four counts of interfering with the operations of licensed stations, which carry the same penalty.

Fuck you, you shallow little bastard of a dwarfed dicked ballbag licking aboriginal clusterfucker.

Bill Cheek was a great man.

Funny... You bag on him, and I am from San Diego.. However, knowing most of the people in and around the San Diego area who where hobbiests and / or tinkerers, your name doesn't ring a fucking bell.

Seems to me you probably knew Bill by reputation, and not personally.

Fuck you for baggin on someone in their death.

TollHolio...

(sorry for the language, but this pissed me off)

Well, Ben,

In all of this thread, I do sense that we could find some common ground even though we may not agree totally. I haven't responded, I hope in any vitriolic or harsh way. I only hoped to point out some facts and I, again, hope, that I haven't insulted you. This wasn't my intent. I also hope that you notice that I never participate in name-calling, and indeed, lots of threads that have this, you don't see me responding in them. I DO try to present opinions and, sometimes, facts in a non-personal way. I cannot judge what people know or do not know merely by reading threads. I am certain that you are quite capable of achieving whatever goal you set upon in the radio hobby. That's why I suggested that you TRY ham radio before you "down" it so hard. For example, today I made a short road trip. I tuned in on my mobile the 6 meter band (50.125 and 50.140 USB) and made a few contacts from NC to Vermont, Canada and New York. On the way home, I dropped down on the 10 meter band (we all know where that is), talked to my friends back home (about 60 miles), and other stations joined in from New York, Michigan, Texas, and Oklahoma. Everyone was nice, we had very nice chats, turning the frequency over, in turn, to each station so that they could log the distant stations. Like your 11 meter hobby, it was FUN, and kept me company on both legs of the 120 mile round trip. I had contact with friends in my own town (in case I had car trouble) as well as being able to talk to stations all over the country. If that band had died out, we could merely switch to another band and keep talking. Ham radio is what YOU, the participant, makes of it. Again, just try it.

73

Jerry

> > You know, that is the textbook definition.
>
> 10:1 is far from the textbook (4:1) definition.

No, I wasn't talking about the 4 to 1 relationship.

And, in all actuality, the textbook definition is wrong, as well. A truly
100 percent modulated carrier will produce 3.998792 times the carrier
power... But close enough.

What I was referring to was the statement :

400 key 12K PEP is 30:1. If that's symmetrically modulated
there will be so much carrier cut-off time per cycle that

you'll sound pretty bad.

All you have to do is clip the negative portion of the audio waveform so it can never drive the carrier to a negative cutoff, and you eliminate the problem of carrier cut-off.... Especially when running a "modulator" type amplifier (and no, I am NOT talking about just any old Class C amp... I am talking about something like the Texas Star, which uses an input circuit that MAKES the amplifier non-linear.)

>
> > Clip the negative portion of the waveform, and you fix that problem.
>
> The problem is too much clipping of the negative portion
> of the waveform.

The problem is with too much clipping of the CARRIER, not too much clipping of the audio drive. (although too much clipping of the audio drive signal will cause shit signals, too...) You have to find a level of drive from from the output of the clipper that keeps the positive portion from flattopping, as well as keeps the negative portion of the signal from driving the carrier into more than a couple of microseconds of cutoff. Look in one of Lou Franklin's advertisements for his processor for a peak into what I am talking about.

How do you figure? Keep the audio input UNSYMMETRICAL, and it can't drive the carrier into cutoff. Simple. Do you get a distortion free signal.. No. Does it sound "LOUD".. Yes. Do I use it, YES.. Does it work.. YES.

>
> > It is capable of holding a 8 Kw carrier, mebbe more, if I had the line

input
> > to do it... The mains sag is what is killing me so far.
>
> Read back and you'll see that your statements are hypocritical.

I don't see where. I can drop a 15 kilowatt carrier, but the tube won't have any headroom for modulation (other than FM). It only has 6Kw of dissipation in Class AB. With around 7Kv on the plate, I pull near 3 amps at 15 thousand watts of output. Their is nothing hypocrytical. You are making the same mistake you used to make with Dennis. Just because something doesn't "sound" right doesn't mean it isn't possible.

>
> > 4CX5000A is the tube.

Stock cb's putting out 4/12 watts have a range of the antenna that you put on them. Generally, the bigger the antenna, the farther you get.

Most on-glass cellular lookalike, 2ft tall raingutter/magmounts types give you about 2 miles to another similar unit.

2 trucks with duals on the mirrors (to another similar unit) probably get 5 -15 miles (depending on how busy the channel is)

I have to Japan with a Stock CB using a 102 inch tall whip mounted to my back bumper on the car, but that was skip, which will affect your range too.

I have seen mobile rigs talk as far as 30 or 40 miles with a good antenna and a quiet channel.

So to answer that with a canned answer would not be treating it justice, it depends on alot of things. Everyone has an opinion on their favorite radios and antennas, so talk to someone who has a vehicle/house like yours and see what they are using.

CB's put out 4 watts on AM and 12 watts pep sideband.
look at your channel selector, it probably says 40 channels, although that model sounds like it might be an old 23 channel. (someone correct me if I am wrong)

Open your search enging and type in cb radio and check out a wealth of info.
also, try more than one search engine.

Steve,
Unless you want to go to a lot of trouble, a mag-mount or a bumper mount antenna seems like your best bet. Depending on who/how your van was constructed, the gutter may not be a part of the metal body of your van. If it isn't, it would be the same as trying to use the fibreglass partion, not very good(bad!). The "lot of trouble" would be to remove the head-liner and applying a metal counterpoise to the fibreglass roof. That would be the 'best' as far as performance was concerned, but would it be worth all the work?
'Doc

3707. Re: antenna suggestions..

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <397E5632.F369B16A@oio.net>
Source record: 45687

Derek,
I won't make a recomendation about a specific antenna, but I would
tell you this. Mag-mount antennas, due to how they work, begin to
have
problems when the input power reaches a certain level. Things start
acting 'wierd' for no apparent reason, (SWR varies or goes very high).
This is because the mag-mount depends on capacitive coupling to
complete
the 'ground' connection. Above a certain level of power, the amount
of
'coupling' just isn't enough to handle it. There's no 'standard'
power
level for all mag-mounts, so "try it and see" is the only sure way of
knowing if you have exceeded the antenna's limits.
'Doc
PS - As a general rule, about 100 watts is where the average mag-mount
starts to break down.

Hi I just got a new export 79-290 , I tuned my 4' wilson silver load to
just under 1:5 : 1 SWR and tried to talk to the radio in my other truck, my
voice sounds like charlie browns teacher, really distorted....

test was from 100 feet to about 2 miles.
tried the MIC button.. no change
tried the LOC button.. no change
Radio was in AM mode
Engine was not running in both vehicles durring the test.
incomming audio was great...
meter was showing 15 watts deadkey and a bit over 20 when talking...

I really dont want to send this thing back

any idea what might be wrong? any suggestions??

Thanks...

I don't see where the amp makes much difference. The
manipulation that prevents negative cutoff is done
upstream (in the audio section of the radio).

I'm familiar with his processor. It doesn't produce the
effect we're talking about (unless of course you modified
it). The effect we're after is positive carrier shift.
He (Lou) talks about that in his larger book.

My statment above concerns the overmanipulation of the
audio waveform--which is it's own form of distortion.
You fix one problem by creating another. You address
that in your paragragh too.

> > > Is that ratio based on personal

I understand that. What you need to explain is how the use
of a T/S mod+ makes you choose to key 400 and peak 12K?
In other words, the way I saw it, you never answered the
original question from above. I can read between the lines,
however. You've chosen to manipulate the audio waveform to
create positive carrier shift, that's why you key so low.
That's the answer I expected to begin with.

This goes back to the last exchange. You went off on
a tangent from that T/S mod+ statement on down the line.

> > > If it's by choice, I'd reconsider

You were off on a tangent. With the above statement you
found your way back.

> > > You still doing the daily with MC?
> >
> > I never did the daily with MC.
>
> Oh... My mistake then.

No, it's his mistake. We planned on doing a daily
thing in the outband area near 80 meters. I held
up my end (set up a station using a full wave loop
cut for 3.2 MHz), but he never got his set-up to-
gether.

> > I sent him some pics that I wanted back and he
> > basically abandonded me. Mesa AZ is not that far

> > he never sent my pics back.
>
> You ask for them back?

Time and again. I'm about to send him snail
mail requesting the return of my photos.

> He never seemed like a thief to me.

No, just self-absorbed and self-important.
He started his own business and "has no time."
He can't find 5 minutes to address an envelope,
put the pics in it and leave it for the postman.
He'll have to make more than 5 minutes to nurse
the bloody nose he's going to get if I have to
go there just to get my photos.

3711. Newbie - Having range issues - Need assitance

Newsgroup: rec.radio.cb
Date: 2000-07-25 00:00:00 UTC
From: Micah <noid@involved.com>
Message-ID: <397e5a9a_3@corp.newsfeeds.com>
Source record: 45691

I have a friend that lives 2 and half miles away up a hill. Now, I want to be able to talk to him and other friends (all of the other friends are mostly closer). Now. I have a cobra 19UltraII in my RX-7 with a center loaded coil.

Part 1:
That seems to work really well except for the interferance from the engine and other components in the electrical system. I got a noise supressor from Frys electronics the other day and install it (properly). It didn't seem to reduce the noise at all. Am I missing something? Let me know.

Part 2:
My friend gave me a GE 4 watt Handheld (with a crappy antenna). It had an external antenna jack. So I hooked up a magnetic cobra antenna. I can't reach from my car to his car (me with the cobra, him with the GE) when we are more than a half mile apart. I'm thinking of fooling around with some amplifiers. I have schematics for a couple different wattages. Now.. my question is. For a newbie. What are some things I should get for a few of the following:

I want a good base station
I want to achieve maximum range with my cobra in my car.
I would like to figure out how to increase range on the handhelds.

Alright.. enough babble. ANY help is appreciated.

In light of what the first response was, (a base unit)
questions first.......
Are you going to put it in your patrol or personal car?
Are you going to use it to monitor Ch 9/19? Or do you want to talk SSB?
Or are you into the hobby and want to talk long distances and have bells and
whistles?

I would go to the nearest place that sells CB's (Truck Stop) and pick up
Cobra radio. They have been around for a long time and continue to make some
of the top of the line cb radio's around. (some might argue that and
everyone has their personal favorites)

AM models
19LTD (small size) AM unit (Most patrols are crowded already, this is what
I would get)
25LTD (medium size) AM unit
29LTD (larger size) AM unit
The last 2 have more bells and whistles like built in swr meter ect...
If you want a SSB unit, then pick up a 148GTL or Uniden Grant, or similar.
Don't forget, your antenna is 1/2 to 3/8 of a good radio system, most
antennas rx pretty fair but only the good ones get out.. The rule of thumb
for antennas is, Bigger is better. Check out some other posts on here to get
an idea of what you want for an antenna.

They want $40/pair. You can save $10 by going
with MRF454s instead. The amp will likely be
more stable too. Request the lowest gain pair
they have.

> There is also the number 8715 under the SRF3749.

That's the date code. That means they were
made in the 15th week of 1987.

What kind of walkie talkies??? CB, GMRS, LMR, HAM ????
Use an outside antenna with what ever you have for more range, weather it be
a handheld or an under dash mobile rig. Almost any mag mount antenna will
work better than a rubber duck on a hand held.

Scott, I haven't had a chance to check out the radio you have, However I doubt the radio should see a 15 watt carrier, sounds much to high... If your not a tech i would suggest you get it to one and have the radio checked out.... Typically 6 or 7 watts carrier is close to max a CB will do and sound decent... I'm sure someone out here has more experience with that particular chassis and will give you a more definitive answer...

I'm thinking a vertically oriented halfwave dipole attached to the side of the building using non conductive fasteners would be an option, you'd only need about 17 1/2 feet of wire for the antenna. As long as you're legal, you could use fairly light duty wire for the antenna. Choose a wire that's the same color as the siding of your house, and paint the feedline coax to match. Should be fairly stealthy and work fairly well...

I have no beef with this guy either but he seems kinda fishy. I have seen him sell stuff on Yahoo! auctions many a time. The only thing is that he sells the exact same thing all the time. You would think that there is something up when you see that. One example is this thing: http://page.auctions.yahoo.com/auction/31886411

I have seen it many a time on Yahoo with that same old banner in front of it.

well this guy is obviously an idiot and if you want to get busted , you can damn sure get it done , if you piss in their corn flakes enough, but if you communicate with them and do what they want you to do, you can certainly aleviate this type of action. the real story is probably how long it took for this type of action to come down. hell , this has probably been going on for years and this guy was probably broadcasting on ham bands. oh well, this fool doesn't seem to understand the game, and it is a game isn't it jerry. but you know, i bet this type of bust just warms the cockles of your pea picken do gooder heart , doesn't it jerry, but you know what, it don't change a thing on two things. number 1, if you ever, and i do mean ever get next to my mobile i will put your ass on hold (of course it all depends on how much adult beverages i have quaffed)and number two, i am not now or ever going to get a license to do what i want on my cb radio good buddy. that is a promise from mr cd that is curious , curious d. and i am back quiet..... .

Micah,
Good questions, and you might even like some of the answers.
Part 1.
Noise suppresion is, or can be complicated. The idea is to find
out what is causing the noise and 'cure' it. On most of the newer
vehicles look for 'resistance' plug wires or sparkplugs. If the
wires are not 'resistor' wires, or the plugs are not 'resistor'
plugs, you'll have unbelievable noise that 'follows' engine speed.
Anything with an electric motor connected to it, wippers, A/C, heater,
etc, can be a noise producer. Electric fuel pumps are the 'newest'

problem in new cars.
The 'cure' is to by-pass (run a capacitor from the power lead to ground), shield, or supress (usually ferrite 'beads') the noise makers. Keep all the radio 'stuff' away from the vehicle's electrical system, as far as possible, and dance naked around your car, after painting your self blue. (The last works better than you think!)
The noise suppresor you installed was only a start, but you gotta start somewhere.

Part 2.
The range from car to car, seems about tight. Not good, but about normal. It depends on propagation to a large extent, and you/we don't have any control over that. You 'load the deck' in your favor by optimizing your equipment, good antenna, radio, etc. The antenna will make the single largest difference in performance. Unfortunately, a mobile antenna isn't very efficient, and can only be 'pushed' so far.
It would be nice if you could use a full sized 1/4 wave antenna (102"),
or larger, but, then you get into the mechanical problems. I seriously
doubt if your willing to mount a 102" whip in the center of your car's roof! As a general rull of thumb, the longer the antenna, the better it will perform. Another general rule of thumb is that the bigger and uglier the antenna, the better it is. If your wife hates it, it's gotta
be good!

Caviat Emptor(sp):
Beware of the claims of antenna and amplifier manufacturors! I won't
say they lie, but they cetainly stretch the truth to the rediculous. Most CB antennas seldom, if ever, have true 'real world' gain figures of
more than 6 to 8 dbd (3 dbd = twice the signal). If it has a gain figure
of more than 12 dbd, and you don't need two acres to turn the thing, they
are lying.
Amplifiers ~can~ increase your signal strength, but what they don't tell
you is that they also 'magnify' any and all the little problems you may
not notice now. Not just in your house, but all around you for blocks. Be
sure you want to go through the hassle before you buy.
The more the devices/transistors/tubes/'pills' in an amplifier, the more
trouble you're opening your self up for. You never 'get' just one failure,
the first one takes out the second, third, etc. That doesn't mean that a

multiple device amplifier is 'bad', but the 'good' ones are not cheap,
and
they are few and far between.

Hope this might help you. I certainly don't mean to discourage
you, but
I think you should go into it with your 'eyes open'.
'Doc

Well, first of all I would like to thank ALL of the people who replied either on e-mail or right here on the board...I really never expected to receive so many responses but I definitely do appreciate the help, I had a couple suggestions and will definitely be trying most of them :)

As for my next question...right now I am running "junk" for radios I have a "tuned" (clipped and peaked) GE 3-5869A that was GIVEN to me (If anyone knows of anyway this can be modified for "channels" I would love to hear from you I have a decent background in Electronics technology i.e. soldering, component recognition, and good with a multimeter =P so I could probably do most of the mods myself, plus I don't care much for the radio :)) and 2 Radio shack jobs...a TRC-492 and a mobile I been using indoors TRC-444. Anyhow now that I landed myself a decent job (Only 18..a youngin' =P) I was looking at some new radios, now I have heard that the Cobra 148GTL is among the loudest talking radios made and have read up on some easy mods that can be done to it..(lotsa channels, super talk kits etc...)but I have also been considering an RCI 2950 and been looking at some Galaxy Mobiles (Dx-99 and down that line) I think that the Cobra is the cheapest but do love the frequency counters on the Galaxys and the digital readout on the 2950s, I was looking for some opinions on which way I should go and possibly suggestions on a decent power supply I could run these indoors with. I hope I can land as much feedback as I did with the antenna question...if so I'll be up and running in no time :)Thank you all that read this.

A capacitor from the power lead on the battery, or the CB radio? Also.. if
its from the battery.. won't that short it out if I put it to the ground? I
don't know much about this. but.. anywho. About the noise supressor. What
if I run power leads directly from the battery of the car to the CB, and put
the supressor on that? Right now I'm just using the in-dash power for the
radio. So.. hmm.. Lets go from here..

> makers. Keep all the radio 'stuff' away from the vehicle's electrical

Well, it might be a possibility, HOWEVER, maybe not in the center of my cars
roof. :-) Got a sunroof and all. :-) Maybe I could put it right infront of

my spoiler. Okay.. how many sports car drivers have CB radios. :-)

My antenna is a HUSTLER - RTS-27L Roof mount CB Mobile antenna. 30" high Q
antenna. Says its tuneable up to 300KHz. Bandwidth. 18foot RG58/U.
I have it mounted in the stock radio antenna position and was thinking about
T-ing it off to use as an FM radio antenna as well.. (would I need a switch
for that?)

Well, the one I'm thinking of making is pretty sweet.. looks like
high-quality components.. If you want a copy, I can do that for ya. And you
can tell me what you think. And get a copy of some schematics. :-) Its a
150 watt @ 4.5 input w/preamp+switch.

the easiest and cheapest thing for you to do is to sell or trade
off that 19 ultra and get a cobra 25 or 29. or a uniden pc66 or
pc76. something that has the filters engineered into them.
get away from a magnet mount antenna and go for one that is
grounded. your gonna like the difference.

Just don't say 10 - 4 Good Buddy. :)

That will bring on a lot of unwanted comments.

To end a conversation it is nice to hear someone say clear on your final.

That way there is no doubt your done with the conversation or telling them
your clear instead of just letting them hang.

Just my two cents worth.

God Bless.

And what ever you do, don't ask for repeated radio checks on 19. They might
hunt you down. :)

It's hare to picture 102 whips in the center of a van. With the way they make vehicles now a day it would seem it would rip a whole out eventually. Sort of like wallering out a whole on the bumper on a loosely mounted antenna.

God Bless

Debbie

In some of the local municipalities it is law that if you are a nuisance to the public and they complain they can offer up tickets for this. It includes cb problems. Most people who are affected by this are bleeding over like the church monitors on Sunday morning or the local emergency equipment.

Yes they can enforce it. At it has been done. Working in law enforcement in Law Enforcement I have seen it done. There is no passing down. It is written as a nuisance. The fine is $250.00.

Or it was 5 years ago. It wasn't done often.

Most grown ups are able to work out their differences and not talk on their equipment during church hours, or if they are interfering with the emergency equipment then go out an buy better equipment or filters.

Technically an 11 meter cb radio should not interfere with any of these things if fingers haven't been inside and amplifiers aren't used. Most hams (I am not a ham) don't have the problems. But they pay a lot more for quality equipment. Someone here will correct me if I am wrong. On the equipment quality.

But enforcement can be done by the local law enforcement. Some cities have written specific language to take care of CB Radio equipment.

Hope this clears up some things.

Debbie

What really begins to bother me is that he is doing the same thing with his full coverage announcements on the dx packet cluster. If he doesn't stop that crap, someone is going to do something nasty. If anyone wants to see his web page they would already have done it by now, and if there is anything worthwhile to see, it will all take care of itself via the search engines. Guy must have some serious ego problem to want to advertise it so much; either that or he is making money on each hit.

I knew Bill since the early 70's. He had just got out of the Navy. We had FUN in the days of early CB. What a loss.

Memmorys will never be forgotten.

Take care Bill,

Owen KB5XE Tripple D -early days-Albuquerque, NM

Wilson mag mts are limited mainly by their coax. A stock W5k is good for 800 peak, maybe 1k for a while. Change the coax to LMR240 and run 2kw no problem.

I too would stay away from a mag mount. How about an 8 foot
whip? They are very efficient and look nice on a Jeep.

That's right ..and that is why a pressurized cabinet is the way to go.
By placing the outlet vent right after the component to be cooled the
air flows right over the hot devices and out the cabinet.

A friend ran a Texas star sweet 16 through his magnetic Wilson 5000 for a year with no problems at all, he sold the setup..... He also currently runs a Texas Star DX500 through a Wilson 1000 mag mount, getting close to a year on that one to... no problems at all..... A quality Mag mount will take the watts, however if you can do it permanent mount IS the way to go...

Professor wrote:
>
> Remove the capacitor...

With some amps it's better to reduce the value rather than
completely eliminate the cap. With no capacitance at all,
and a low dead-key with alot of carrier cut-off per audio
cycle, the ralay may chatter. If that's the case, use a
cap that's 25% of the original value.

I totally agree..... I had a problem with a local bozo a few years ago, I was killing his crack-houses intercom system.... This was next door to where my shop WAS, needless to say i moved away from the idiots.... Anyway the local PD came by and informed me of the problem, he said it was a violation of a local city ordinance, asked me if i ran in excess of legal power limits, I simply stated as an Extra class ham I very seldom ran anywhere near 1500 watts.... that pretty much ended that... However we did have a bit of a chat, i was informed that even though he would rather not hassle with such petty things it was the law... He also informed me that even in cases where illegal amplifiers were involved they had a tough time prosecuting because proving the actual violation without anything less than the violator announcing his full name and address with an officer present was next to impossible..... I asked him if he wouldn't rather be over busting the Coke dealers, his reply was "Well yeah, but the towns only Judge said off-limits and he didn't want to lose his job.." Well needless to say I moved my business location, The Judge's Coke dealership still thrives!! Any i don't worry about his sound sytem..... An occasional pass or two in the mobil always brings a warm response....

I have the right to choose to obey the law. And deal with the consequences of my actions through due process of the law.
It is no different than speeding in a car with a motor designed for a race track.
What or who is affected by a modified scanner? Scanners were around before cell phones and cordless phones. Most of those are digital now so the old scanners and the modifications are pretty useless for listening to those devices.

Many of the modifications that Bill Cheek publicized were prior to the law. Fortunately we still have freedom of the press and speech in this country so his books are still available.

I guess a person like you would burn your books and turn in your guns if someone passed a law.

Myself, I will continue to enjoy, support and fight for the freedoms afforded everyone in this country regardless of what unenforceable laws your elected government can dream up this decade.

Jeff, Comparing Bill Cheek to a drug dealer is simply ASSANINE!! as is the Cell laws..... If a person needs privacy DON'T use a cell phone..... There is a very large number of laws on the books through-out the US that if enforced would cause a CIVIL WAR! some of these laws ar ancient!! I'm not a Scanner Buff at all..... I could care less about modifying scanners..... I do however recognize Bill's name, Its unfortunate when Cancer or any other disease causes an un-timely death! Any ones death! Again I'm not a Bill Cheek fan, but even my casual glimpses of articles written by him, allow me to conclude the fellow made some valid contributions..... Other than BLOWING YOUR HORN, what contributions have you made??? I'm not refferring to a local level either! I don't recognize your name from any National publications..... No matter what subject a person chooses to write about critics will always be there! Pleasing everyone is highly unlikely! Why Rip on a guy after death? If you felt this negative about him, express this to a living person..... Not after he's dead and gone!

To Bill's family, hats off to the man!

Absolutely amazing!! A simple question like this get blown into insults, debates, and incorrect info about cooling tubes! LOL!!!!

Ok, Heres the deal!! you don't want to cool only the transistors, it is a good thing to cool the inside of the amp!! I've repaired quite a number of solid state amplifiers that have had the solder melt from heat generated in hard use! Typically the the i/o transformers is where the solder melts, then the globs sho them out! final score slder blob +1 output ZERO!

If i could only cool my amplifier wirth a single fan it would be directed at the heat sink! Ideally a fan cooling internal components and another for the heatsink.. The direction of the airflow doesn't really matter cooling internals, however in my opinion blowing air through the amp would be better than sucking it out, don't forget you will need some kind of escape vents for air to flow.. Regarding the heatsink Air blowing through it would seem to be the most efficient....

Unless you really pound the little amp a fan is not crucial.... It will certainly increase keydown time....

Good Luck, hope this helps!!

Many, if not most of Bills mods had nothing to do with cell. Adding
channels, getting rid of keyboard beep, rf meters , receiving ssb on the
2006, speed up mods. . . Modified does not mean "opening the cell freqs".
Any way , most of the cell mods were legal when his books went to publish.
I'll miss Bill as well. We sent a few e-mails back and forth. He was a good
guy. He could be a jerk, I'll admit that (that's true of many of us). But
at least he posted a BUNCH of on topic , helpful info.
It seems to me that this is the perfect time NG bickering to end.

Good scanning !

I have a PC122, it seems to work ok, I get good reports on it.

I think that it isn't built as good mechanically as other Uniden radio's, like the Uniden Grant or the Cobra LTD/GTL line. They have better controls that will last longer. You can get a Uniden Grant for around $150 and a good antenna for around 50 bucks too.

Good Luck

DT-001

All the commercial solid state amps I've seen blow air onto the
transistors, and tube amps blow air into the amp and up from the bottom of
the tubes.

Okay. here's what I did. I went out and bought a 60" (5') Valor base loaded whip. going to mount this tomorrow. should be getting my new Uniden Pro520XL tomorrow as well. I also bought some stranded 10guage wire to run straight to the battery. All I need now is CAPs. For isolating the CB from the rest of the car, what voltage and pF cap do you think I should get? also. what type. thanks!

Micah,
Run power leads straigh to the battery (right!), put the capacitor between hot and ground leads (caps' are open circuits to DC, short circuit for a/c, you don't want the a/c). The ferrite beads on the power leads do something like that too, (not really, but not enough coffee yet... not gonna try to explain that).
'Doc

3793. Re: Whats the mobil best cb radio?

Newsgroup: rec.radio.cb
Date: 2000-07-26 00:00:00 UTC
From: maniac9188@aol.com

Source record: 45799

Try a Uniden Pc78XL, excellent radio. You can have it Peaked and tuned, along with having the "hot finals" (bigger output transistors), and a connex echo board installed. also, be sure to have a hi/low power switch installed, in case you ever decide to go with an amplifier.....

You won't be dissapointed......The 78 will typically do close to 30 watts swing, if its tuned up right....(with hot finals)

Maniac "373"

I have a Polycomm Pro with hand mike, power cord, polycall which connects between the mike and the radio plus sams photofact. Also I think I have the owners manual too.
This radio was working but no longer receives, otherwise its in OK condition.Whats it worth? might sale.
Thanks
Jeff

3800. Is it Possible? GE Base on Ebay Swings 35 Watts

Newsgroup: rec.radio.cb
Date: 2000-07-26 00:00:00 UTC
From: alg460@aol.com
Message-ID: <20000726112036.08347.00000374@ng-fj1.aol.com>
Source record: 45806

Noticed this General Electric 3-5869 Base on Ebay and since I have the exact same radio just wondering if its possible. I can get mine to swing about 12. I am not doubting the seller or trying to put him down in any way but I also have a Cobra 2000, a Cobra 142 and a President Madison and none of them can swing much over 12 watts. I do have some knowledge of electronics and it is my opinion that the "single ended" type final used in these radios simply cannot put out that much power when running from 12 - 15 volts. I believe the Galaxies and RCI's use a " bridge type" amplifier for the final using two transistors to obtain peak outputs of 30+ watts although I could be wrong. Just wondering if anyone has comments on this or if anyone knows what was done to that radio. Also as is, mine is quite a screamer and I'm told its quite loud and clear with an astatic hand power mic so if anyone is looking for a decent simple radio here the link to the one on ebay.

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=387056577
It looks to be in great shape.
Tony

I work in law enforcement as well and I can tell you that all of my fellow officers do not wish to enforce the cb regulations. They have other things to worry about. And if there are other police forces worrying about cb, they have too much time on their hands.

STRICT LAWS URGED FOR NET STALKING

SACRAMENTO -- Federal and state laws should be strengthened to help curb the growing problem of online stalking, a U.S. Justice Department report recommends. Internet service providers, which link users to e-mail and the World Wide Web, report a growing number of complaints about harassing and threatening behavior online, the report said.

Honolulu Advertiser, 9/16/99

The Illinois State Attorney of Cook County, has proposed legislation prohibiting harrassment or threats on the Internet. From the reported proposed penalty, threatening or harrassing via the Internet would be a Class 4 felony in Illinois, punishable by up to 3 years in prison. The state legislature has not yet considered this proposal.

Mike wrote:

(((So that 50Ohm antenna, at a 1/4 'electrical' length from one end of 75ohm cable to the other, is 'transposed from 'low' to 'high'. In essence, that 50 ohms becomes close to 100 ohms, for 'each' leg of the cable. So you see that 100ohm cable just wouldn't work.)))

According to most experts your statement is correct. I also believe it is true, but only under certain conditions. Your reference to a specific (or close) frequency is well taken. I feel there is another condition that must be accounted for however.

These ideas are based on personal experiences and trial and error efforts only. Some may say this rules out of being reliable. But maybe it is worth considering.

Mike, generally speaking, what would happen to the impedance if you used 100 ohms coax for the co-phase harness you describe?

Is it possible to determine exactly what this impedance would be?

If it is so, what would this impedance be?

Hang loose,

Marconi

I have the Palomar 225 and it is a decent amplifier. Doesn't put out a lot
but it gets the job done for me. But seriously, if you need it to talk only
that far, get a better antenna and check the SWR on it to make sure it is
nice and low. Otherwise, linear or no linear, your signal will still suck.

Especially if his buddy is on a hill.

On the other hand, we're assuming a clear channel.
There could be alot of interference or interfering
stations in between them.

3833. Radio and Antenna Suggestions

Newsgroup: rec.radio.cb
Date: 2000-07-26 00:00:00 UTC
From: Gregory Hamilton <ghamilt7@bellsouth.net>
Message-ID: <397F399C.58AB1E5D@bellsouth.net>
Source record: 45839

I am trying to decide what is the best CB and antenna to install in my truck with limited funds. I only have about $200 to spend for the CB and antenna (I already have a coax cable). But I am looking for the best bang for my dollar.

One key feature I am looking for is a weather band as that I am in construction and weather plays a major role in the minute to minute activites.

One thing I am looking for also is upgrade ability. I am willing to spend some money down the road to have the radio peaked out using other devices.

Of the radios I have looked at so far are the Cobra 25 and 29 NW ST WX and a version from radio shack made by Uniden.

If anyone has any recomendations (does not have to be ones listed above) along with a good antenna it would be greatly appreciated.

ghamilt7@bellsouth.net

hmm.. well if you want to give me the wilson i'll be more than happy to take it off of your hands.. i bought a wilson yesterday and 10 minutes after having it installed i was talking to someone in west virginia.. which is appx. 300 miles away from here.. never could do that with the old antenna that i had... and i had a guy about 9 miles away yell at me for stepping on his buddy's signal, so i would say the radio and antenna are working fine.. as far as swr.. how's 1.1 sound? never goes more than 1.2, i'd say that's just on the money

You want to draw the heat OFF of the unit, not blow it in... make sure you
turn it around so that is sucks the air OUT.

I should have checked the Copper's link first. Your right...they do have them on sale for $149.

It figuires those freaks would pull that.

I will now sell mine for $100 flat...plus $5 to ship. Thanks for the information...rock on.

3839. Re: Eagle 10 Meter

Newsgroup: rec.radio.cb

These things for $150...not unless your asleep. The Eagle Spitfire 454 10 meter radios cost $179.99. Then you would have shipping & order proccessing charges, and possibley c.o.d. charges. Mine cost $196, and i am selling it for $115 total. You might be referring to an Eagle Spitfire on Copper's like-new but not-new radio list. Mine is perfect...and has had the channel modification done already. So even if Copper's had these units for $150, which they do not, mine i still a very good & fair deal.

hi there.. i have a great suggestion for you.. i just purched a new system within the past month.. i bought a uniden pc78-ltw, with 7 weather stations and backlit control knobs.. the shop peaked and tuned the radio and added some stuff, what exactly, i'm not sure, but i was told it will swing about 35 watts.. it does have kick, i get compliments for how good the radio sounds.. as far as the antenna, i just purchased a wilson 1000 magnetic mount, and within minutes of installing it, i was talking to people roughly 300 miles away no problem with the skip.. never could do that with my old setup.. this radio is VERY nice and after looking inside and comparing it to my old cobra, the uniden is made so much better.. overall a perfect radio, and with the wilson antenna i find it to be a very nice system for not much money.. wilson 1000 antenna is roughly 60 bucks, give or take a few.. and the radio i paid 130 for it all tuned up and ready to go.. probably a little too much but hey, i'm supporting the little guy here in the town and they're really nice and they'll do anything to help..

well, if you need anything else i'll be more than happy to give you a hand.. when i was looking for help on the same subject i got a lot of responses from the people in this group and appreciated them all, so i'm happy to be returning some of the knowledge.. take care

My Ameritron AL-811H (4 - 811A's) has a pressurized cabinet . The fan blows into the cabinet and the only way out is through a vent directly opposite the tubes.

And this is the preferred way, IF you can direct the fans pressurized
air at the heat radiating device. If you can not aim the air properly
then it would be best to draw from the entire cabinet.

WELL EITHER BLOWING AIR OR SUCKING WILL WORK... Depends on how the chassis
is setup if the air draws thru the heatsink fins this will be ideal..
Whether it blows into or sucks it out makes no difference really .. as long
as the air is being drawn thru sink...

Yes !. I know that CB radio is HF, that 2 meters is VHF, and I know perfectly what's UHF. And I know perfectly the types of propagation, using the differents frequencies.

But he asked what is the better system to comunicate between multiple vehicles on route. If he don't wanna use the cellular phones, I repeat again that the best system is use the VHF or UHF movil transceivers, better than the city band. And of course, better use movil than portable equipment. That's all.

I own the RCI 2950...HR2510...and a OLD OLD OLD 148GTL radio(around 25+yrs old) Of all three I (ol fart) use the 2950 in my truck and really like it! My Son (whom is 20) swears by the 2510 and my Son-in-law (whom is 21) will fight you for the 148 GTL!! So there you are...It all depends one what a fella wants his radio to do. All of those radios are good...however I have heard not so good of feedback on the newer Cobra's..(And no is it NOT just because they are a "commie radio" as a person on this newsgroup likes to remind us all..

Not much help was I.??? :) Just goes to show you that out of three different radios in and around the same household we like different brands!!!

In article <397E94B3.A8D8804F@home.com>, Johnny <madshagger@home.com> wrote:

1. I don't know what you mean by "putting on hold",. but if you mean preventing me from using my radio, I seriously doubt it--too many frequencies, too many bands for me to use.

2. If you are then successful in "hindering" me, then I am positive that my Chevrolet will move quickly enough away from your "mobile" to negate any effects.

3. I don't see what this has to do with the Florida guy.

They are two DIFFERENT guys..One N.J. and the other one is in LA. The Antenna Man on Yahoo is legit...of course I am not saying that the one in LA is not...howegver I did get quite a scare for about 6 or 7 weeks!!! And antenna man if you are reading this it is VERY important for you to email ASAP. Greg had alot of questions and I am trying to set the record straight in my case. The state of LA is serious about catching crooked internet deals..and once you get the LSP in it look out good gollie mollie...they take off with it!!!

Turning the fan so it blows the air OUT of the amp would be better in my opinion. Sucking air into the amp would also suck dirt, sand, etc. into the amp guts.
Just my opinion.

How about a Uniden PC122XL and a 102" Stainless Steel whip? This would give you AM and side band, and a good antenna. You should be able to do this under 200 bucks.

Whether the fan blows or sucks there is going to be an intake port
somewhere and an exhaust port or vent. So either way crap can get
blown in or sucked in. Big chunks are removed by the fan screen and /
or the vent screen.

Hey hey.. calm down now... I recall saying 'I'm a newbie'. I have a huge antenna laying around 8' fiberglass marine type antenna (Going to mount it on my roof or on my fence).. and my main goal isn't to JUST talk to him. (but that WAS one of my main problems). I want to increase my distance to talk to EVERYONE. But.. I totally don't want to spatter crap on the waves. I got some pretty negative feedback on this. I hope ALL of you CB radio people aren't this cruel and non-helpful. I do thank those who DID help.

PS. Be thankful I'm not one of those kids that uses CB to piss people off and use nosie boxes and reverb/echo stuff. Now THAT is worth getting pissed at.

The only thing I have ever seen that improved one was adding another director to it. There is a "mod" that adds another wire to the reflector. Don't do this one, it makes it worse.

3867. Re: Antenna for Fiberglass top conversion van

Newsgroup: rec.radio.cb

Doc's idea of putting a counterpoise under the roof is pretty good. I've taken the headliner out of a conversion van and it was not a bad job at all to take it out or put it back. Just took out a few screws and it all came out as a big panel. All may not be built this way.

Throw all your equipment in the garbage and spend time with your family and forget about. All the problems solved!!

Thx for the info on the tubes. I was looking for some new ones if they were still making them. I had tried NOS ones a couple of years ago in the stereo amp and they were very gassy.

There wer e quite a few amps like this around in the mid 70's. For 4 watts in they gave about 40 watts out. Some had a big enough power supply that you could add a second tube and double the output power if you had enough drive. 40 watts is a good power level, it should allow you to have a good signal all the way out to your radio horizon.

Were both radios set to am?? Sounds like the one you were receiving with was not on the same mode or clarifier cranked.

> Thatï¿½s all.

Yes, in fact I don't care what the system is. I just want to be able to
easily communicate between vehicles en-route.

I realize this is the wrong group to look for solutions other than
Citizen's Band, but I called a local Motorola dealer and they suggest
a set of VHF hand-held radios, and say these will work in the vehicles
on the high way (in fact, they say this is done all the time).

However, I understood VHF to be line-of-sight. Won't the vehicle's
body get in the way of the signal, or does the signal really need
something like a mountain to block it?

Thanks again for any help, and sorry about the VHF/UHF talk in this NG.

Bill, I think someone said it before "Dying is not a laughing matter".

Anyone who tried to make a life helping and catering to the people that populate this hobby has to be commended.

From the little I know most everyone who has a modified scanner owes Bill Cheek a thank you, I haven't found anyone else who has contributed more to the hobby.

The "A" hole that started this thread has already received more attention than he deserves.
My suggestion is to show our respect kill this thread and not be lured into anymore regarding a persons death.

The tubes are what need to be cooled. In the other case the heat is being transferred to the sink so air being mover across the sink would be more effective. Given the size of the I don't think it matters. His present setup with the fan blowing into the case allows more dust and dirt to be forced into the cabinet. Over time the dirt will serve as an insulator and hold the heat in.

Best bet is to tap your A/C with a small hose and hit the coils with some of that 40 degree air.
It will surely be "Happy Happy"

In order for a fan to blow out it has to be able to suck it in from some where. In this case dirt would get into the amp either way. Did you ever look in your computer?

You are correct. A good ball mount with additional stiffening under the sheet metal is definitely recommended for large heavy antennas. If your lucky you may get the stud through a rib in the roof to provide the support.

I never heard of the fellow, but seeing he's gone that's a tragedy all by itself. That he was important to so many people makes it doubly so. And only 50. I am muchly sorrowed.

I had one of these and if tuned correctly key should be around 7 swinging to the low to mid 20's depending on the radio.

Were you talking on the same band as the receiving radio?

3893. FS: RCI 2970, TX 1200 and other assorted equipment

Newsgroup: rec.radio.cb
Date: 2000-07-27 00:00:00 UTC
From: "Mr. Breeze" <mrbreezej@netscape.net>
Message-ID: <397F7E54.440D337B@netscape.net>
Source record: 45773

Hello all, I am selling all of my radio and test equipment. Here is
the list:

1. One RCI 2970 10-12 Meter radio; 50W AM/FM/CW 100W SSB $250
2. One EC 2018 Road Noise Turbo microphone Included with radio
3. One Texas Star 1200 amplifier AM and
SSB $300
4. One Workman 2K Low Pass
filter SOLD
5. One 24VDC 1.5F
capacitor
SOLD
6. Two Radio Shack external
speakers $5 ea
7. One Super Penetrator mobile
antenna $20
8. One 6" spring included with antenna
9. One 3 pad magnetic mount with 14' of RG8U 95%
shielded $20
10. One DAIWA Cross-Needle power/SWR meter 2KW max range $100
11. One Radio Shack 3A power
supply $25
12. One Radio Shack Frequency
counter SOLD
13. One 300 W MFJ 260C dummy
load SOLD
14. One 1.5KW MFJ 264 dummy
load $40
15. One 60A DAIWA power
supply $150
16. Assorted electronic parts in storage drawer
cabinet SOLD

All equipment is like new, REALLY. I take care of my equipment. The
radio and the amp are 6 months old.

If you responded to an earlier for sale note a few months back, I lost
the messages, computer problems. Email a response if interested.
All prices exclude shipping charges. Buyer pays shipping
and money order only sales. I am in the Washington DC area if
interested in seeing before buying.

John

P.S. I also have a 100MHz O'scope that sometimes works and sometimes
doesn't. It looks like a power supply problem that I was too lazy to

fix and now it doesn't really matter. It is a Textronix with all manuals. Make me an offer if interested but it will probably cost more to ship than you may be willing to pay.

Hi,
I was given an Pal 200m mobile tube amp and am wondering if there is an amp tech in the Maryland/Virginia/DC area that can give it a look to see if every thing is ok. I dunno if I am giving it enough amperage (25 amps from a battery as well as a separate power supply I tested it on) but the thing does not seem to work real well. I realize it might be a lost cause since it is so old but I really would like to see if I can get some life out of it. It uses two 8950's and a 12JB6A (I think). Where can I take it or is there anyone here that is really good and RELIABLE at servicing these things? Thanks!

Well, that is what you get for asking this group a question. All but a few are total assholes!!! Rarely do they answer the question that was asked. All they know how to do is open more cans of worms.

I would check my SWR on my antenna.
If your SWR is low and someone that is 6 miles away isn't knocking you socks off, you may want to consider getting another antenna. I would recommend the Maco 5/8.

If you are certain your antenna is good and you have a swr reading of 1.5 or less, then see about an amp.
The Palomar 225 is a great amp for the money. I have owned one myself and have had no problems with it. It's probably the best bang for the buck. I would recommend buying it from Left Coast Radio. Great prices, and great customer service.

Also, make sure your radio is properly tuned and peaked. This could make a huge difference, not only in your transmit but your receive as well. I would recommend Jim Norton in AL or Panther Electronics.
Hope this helps!

Jeff,
Many (90% or more) of the mods that Bill Cheek developed have nothing to do with listening to cell phones. Improved squelch, computer control of scanners, expanded memory channels, add-on signal strength meters, baseband audio taps for recording signals, just to name a few. And modifying a scanner isn't a crime, listening to phone conversations is. It's what you DO with the radio that can get you in trouble. BTW, id you think drug dealing isn't a federal crime, you've apparently never heard of the D.E.A.

I myself use one of Bill's mods, a discriminator output tap, to monitor and decode EMWIN (Emergency Managers Weather Information Net), which is distributed by the Nat. Weather Service and rebroadcast by our local amateur radio club. Ironically, it was this mod, a "data-slicer", that got Bill arrested last year. The info is freely available on a N.W.S. site. Go Figure!

So you believe it's okay to break laws you don't like. Are you able to limit the number of laws you violate? From what I've read, it's doubtful; many criminals reach the point where determining right from wrong in any area of their life becomes an impossible task, holding in contempt any societal boundary which interferes with what they desire.

Good luck with your recovery, T.L.Bryant!

Many amps have small holes as exhaust vents. If moving air tends to be cooler than still air, how can a pressurized DC/mobile amp run cooler? It seems to me that having an exhaust vent at least as large as the fan opening would increase the airflow to the point of maximum heat transfer.

>I'm not a Scanner Buff at all..... I could care less about
>modifying scanners.....

I'm a scanner buff... but I don't see the attraction in
listening to cellular phones. BORING! Who wants to listen to
some guy call his wife and let her know what time he'll be home
for dinner? Besides, most people are moving to digital PCS.

Now cordless phone conversations, those can be interesting
(disclaimer - I am not saying I listen to them!). People do not
realize that cordless phones are RADIO TRANSMITTERS that can be
picked up within a several block radius with a good outdoor
antenna, sometimes even from a greater distance. It's amazing
what kind of information people give out over cordless phones.

I use a cordless phone myself, but if I'm going to give out
credit card data or something I ALWAYS unplug it and use a
regular corded phone. It's unbelievable the number of people
out there still using 25-channel 49 MHz unscrambled cordless
phones, and even more amazing people don't realize these can be
heard from quite a distance on a scanner. It would be nice if
someone educated the public about this, because an unscrupulous
person could commit all sorts of crimes using the information
heard over cordless phones (second disclaimer - I do not listen
to cordless phone conversations, never have, and never plan to).

Don't waste your time trying to
speak any reason to this fool
Glen Quarnstrom Lenny. He's been
knocking around this newsgroup and
others for years and is
a commensurate asshole.

Glen seems to get his rocks off
by spreading his bile and
then sitting back and watching as folks get
mad at him. The guys a total whack-job.
He's probably in need of psychological help.

He's the type of person if he don't get no attention
his anger starts welling up inside and you read about
folks like him later going into a post office
or shopping mall somewhere with a semiautomatic.

Source record: 45909

Really there is no difference providing the air volume is the same over the sink. Really the best way is too make sure that the maximum airflow is blowing over the sink by making a seal at each end of the sink and attaching the fan to one of those ends. This insures that all the air that the fan is moving is traversing the sink. It's exactly like installing a window fan in a window and making a seal around it. This is the best way to move the maximum amount of air from the house to the outside or vise versa... Without the seal... you get inefficiencies due to the air currents circulating around the fan... from input to output.

From: cbnewbie@aol.com
Message-ID: <20000727091752.29074.00000101@ng-fj1.aol.com>
Source record: 45912

Hello,
Decided to upgrade my antenna. Planning to go with a permanent mount, but am not sure how to really install one. I know that you have to drilll in the roof, but that is about it.
Anybody help with a better idea of what is involved? Like, do I need to remove the headliner or just drill through it, do I need to brace the antenna somehow, how to route the coax......stuff like that.
The vehicle is a 92 Jeep Cherokee if that help and am planning on Wilson 1000.

Thanks for any help as there isn't any CB/Radio shops around here and no one I found that could help me either. Thanks

i hate to tell you this, but such request for info reguarding such things will not be granted to you. what you will hear is a earfull of various comments about how you should learn how to do it yourself and not be spoonfed, etc, etc, etc. besides that there are a few that are trying to make their wad off this cb shit, and this internet has given them another tool for attempting to pry some of those hard earned welfare dollars off of some of this white trash, you know how it is. so i think no one will send you a schematic for this thing because it represents dollars to some of the so called cb radio shops who sell this stuff. i hope you get my drift. one of the first things i noticed when i started hanging around here is the politics of the situation. which is fine , i can understand that. but i will not now, or will i ever kiss anyone's ass for information. i am just hard headed enough to figure it out on my own. i suggest you do the same, that is of course , if no one fulfills your request. of course you could kiss up to peek a boo hoo hoo. he knows how to build them. supposedly he was going into business with 123 when he left xforce to start his bullshit box company known affectionately as mo watts, he he. but i guess that bird aint going to fly. start whispering sweet nothings in his ear and he may just help you out on this deal. after all it has been said by non other than world wide crackhead,(one of his little cb good buddies) that he does this for fun and not for money, which is a novel scheme if i ever heard one,.....this is cd, cd, curious d and i am back quiet.....

Source record: 45928

Well... the three major reasons as I see them are:
1.) Permanently mars the vehicle and is unattractive to potential buyers.
2.) Has a potential for water leaks over time.
3.) Unnecessary for running a Wilson1000... absolutely no performance gain over magnet attachment!

As far as I'm concerned... a permanent mount is only needed when extra mechanical strength is necessary. About the only mobile antenna you could make a case for using that type of mount is a full 1/4wave whip or one of those extremely top-heavy whips with that big ugly coil.

If the air is moved across the sink then you don't have to worry about the fan being a source of dust in the internals. The sink is where the heat transfer is taking place. The greater the delta T across the sink the more efficient your cooling is. An amp in a 110 degree trunk with a fan is worse off than an amp under the seat in an air conditioned car at 75 degrees with no fan.

The instance of an amps solder joints melting surely would not have been corrected by cooling fans. This would be caused by volting an amp that wasn't built for it or a mismatched antenna system or just a plain old short or component failure.
A fan supplying uncooled air could not have provide sufficient cooling to prevent the solder from melting.

I never looked at a DaveMade cooling scheme but it would seem logical Not to take the hot air from the sink and blow it across the board.

John Doe, this posting by you contains the KAK WORM, I've cut a portion of the script from your posts source..... This is a form of a virus which is only tranfered via a bug in outlook express, didn't bother me, I've already gotten the security patch from Microsoft.... Suggest you and anyone who has not already added the patch from MS clean this from your computer and apply the patches....

Menu D=E9marrer\\Programmes\\D=E9marrage\\kak.hta":"C:\\windows\\Start =
Menu\\Programs\\StartUp\\kak.hta";agt=3Dnavigator.userAgent.toLowerCase()

You will note the reference in the cut portion of your postings source to kak.hta, this verifies the presence of the kak worm.....

Just thought you might want to know......

Hello to all,
I thought I would share this with you:
The local police where I live use the CB and talk on it also so doesent the state police.I have talked to a few of them and the majarity run converted galaxy dx-77's and a few run the rci 2950.Also most of them have linears.about six of them use shooting star or palomar 225's and three use texas star 667's so what does that tell u they are just as bad as we are he he he
This is the one and only genocide from downtown clarksburg wv and we are down and out!!!

Kevin,

Well said, however the small minded, unknowing, upcoming lawyers real or imagined always relate to modifications as illegal. Because like most of their species they usually don't know what they are taking about until someone teaches them. Kind of like monkeys.

agreed Professor..If in the future, after you get a year or so of "air time", then you can decide of ya want to install a "big radio" setup, (including hard mounting those 1/4 wave big ol' coil spring antenna). As far as selling the Cherokee, if it has the inline 6-cyl 4.0 engine, those trucks have no problem whatsoever reaching 250-300,000 miles if taken care of. Ill buy it even if'n ya drill a hole in her. :)
Good luck Newbie.

If you mounted it in the center of the van you would only need a small metal hub, say a large tin can lid. Solder about 8 wires to this evenly spaced around it and stretch them out conecting them to the nearest chassis metal. I did this on a fiberglass camper shell on the back of my pickup and it worked great.

A while back I was browzing at a truck stop CB shop and noticed that the guy had a bushel basket full of dead amps that he claimed "were not worth fixing". I got the whole lot from him for $20. All of them were fairly easy to fix, even the ones with missing parts were not that hard to figure out. Sold all of them except a couple I wanted to keep, just saying that places like this may be good for finding what you are looking for.

Get a trunk mount Wilson and put the antenna on the hood. Look for any rubber gauments in the firewall, floorboard, etc and run the coax through them. Look and compare the wilson 1000 & 5000. The 1000 is a good antenna, but the 5000 is made 10 times better. Look at a cutaway view of each and you'll see for yourself what I'm talking about.

CitySlicker <manno_d@hotmail.com> wrote in message
news:8lprmn$n4f@journal.concentric.net...
> The instance of an amps solder joints melting surely would not have been
> corrected by cooling fans.

BS! I suppose you also think the earth is flat?? Can we think for a
minute.... WHY DID THE SOLDER MELT??? WOW A REVELATION!! IT WAS HEAT!!
Yes excessive heat caused by the operators lengthy keydown period! HOW CAN
WE KEEP SOMETHING FROM MELTING?? WOW another REVELATION!! WE COOL IT!!!!
HOW CAN WE COOL IT??? WOW A FAN!!!! While it may not be the most
efficient method of cooling it beats nothing.....

This would be caused by volting an amp that
> wasn't built for it or a mismatched antenna system or just a plain old
short
> or component failure.

Nope not volting..... I've done it myself on a 2970's output
transformer... none of your reasons apply to ANY of the ones I've seen...
The 2970 and the others I'ves seen Simply reached the melting point of the
solder, the solder then liquified and newtons discovery caused it to drip
onto and acrossed the output transformer.... And NO nothing else was
shorted, remove the excess solder and the amp is back in business....

> A fan supplying uncooled air could not have provide sufficient cooling to
> prevent the solder from melting.

When did I mention uncooled air???? A fan WILL AND DOES HELP prevent
the internal heat..... I NEVER SAID ANYTHING ABOUT UNCOOLED AIR.....
Even if it WAS UNCOOLED AIR as you put it, and it was at ambient
temperature, at least, a fan would have increasedthe time it took to melt
the solder, and most likely WOULD HAVE PREVENTED IT COMPLETELY.... If your
going to attempt to pick-apart my posts please do so with common sense, and
also try to direct your criticism to actual mistakes, not the imaginary
ones... Also since you have no clue as to what the circumstances were
when the amplifiers brought the solder to the melting point you really may
want to refrain from attempting to diagnose causes....

it doesnt blow across the board it is sucked in from vents in the back of amp, then thru the fins the length of the heatsink and then out a small space in front of the circuit board and straight out the top ... the whole heatsink has air blowing thru the fins not on top of heatsink ...

Can anyone tell me how one would go about modding a 23 channel crystal controlled Palomar "Palorama 21" for other freqs?

This is for educational purposes only.

I recently acquired the radio and was wondering how much I can swing the freq. range down....

like to receive the 25 MHz Shortwave band....yeah.....to receive them...

can someone help me out in figuring out the combination of crystals and such?

Thanks,

SMB

Jeffrey I see that you are in Hawaii! Do you own a boat? If not yo
had better get one as you are breaking a state law by not owning one.
>All residents may be fined as a result of not owning a boat.
If you live in Honolulu you better be careful when in any parks, if you
are walking around and a bird fly's away you can be fined for bothering
it.
>Within the limits of any public park, it is unlawful to annoy any bird. (SEC. 10-1.2)

For all you people that live in Los Angeles California, did you know
that you can legally beat your wife? But only with a strap that is no
larger than 2 inches unless she says it ok to use one bigger.

>It is illegal for a man to beat his wife with a strap wider than 2 inches without her
>consent.

Killr,
I am amazed at you astuteness but what temperature does solder melt at?
Assuming a 90 degree ambient day how much air would you have to blow across
the board to prevent the heat from building up enough to melt the solder.
The best that conventional cooling setups can do is help reduce component
failure. If the board is getting hot enough to melt the solder there is more
heat than a couple of 3" computer fans can take care of.

If you check out the prof page you will see he is using a heavy sink with longer fins then you will see on other amps. The longer fins translates to more surface area which increases the capacity to cool.

If the fan is only going to provide a few more degrees of temp loss and you are already below the temp with your heatsink design why bother. Or if your going to put in the trunk in the Texas heat why bother. There wouldn't be enough temp. differential for the fan to be anymore effective then fanless design.

If you ask most amp builders why they use the number of fans they have on a given size amp they usually will answer that is what would fit.

Just a quick note to Jerry and that other unnamed guy. I haven't forgot our discussion. I just want to spend more than just a few moments to give a proper response, if that is possible. Its hard to sum up all of my thoughts on this subject in just a few words. With that in mind, I will get back to you later on, maybe the week end.

After reading and responding to this thread I recalled a question
on a test that I once took that dealt with a similar matter.

The question:
If you have a square foot of ice sitting on a table at room
temperature, and have a fan positioned one foot away, what
would melt the ice quicker? Sucking or blowing?

I didn't say it wouldn't benefit... I just said it's not necessary on my
amp.

Agreed... solder melts at about 650 degrees F.
If that amp got that hot... there is something seriously wrong!

Again it depends on the air flow across the cube. If you put the cube in a sealed box with a fan at one end and a hole at the other the it wouldn't matter if the fan was pushing or pulling... the same amount of air would be moving across the cube...

Come on... get serious. Look at the heatsink I'm using and the length of the fins. Texas Star, Palomar, and all the rest are using smaller fins that equate to less cooling ability. They do that to keep the costs down and the profits up. They are not worried about premature failures of the transistors... there is no warranty on the transistors!

Source record: 45994

Yeah, ok, whatever..... Its not uncommon to have the solder melt, I'm not talking about the whole board..... I'm referencing the output transformer, I didn't have any reason to post lies or exageration..... Have you ever tried to solder with a low output iron with a room fan blowing on the work? it makes a difference....

CitySlicker <manno_d@hotmail.com> wrote in message news:8lq4nn$pbc@journal.concentric.net...
> Killr,
> I am amazed at you astuteness but what temperature does solder melt at?

60-40 is typically around 180-190 degrees C.....

> Assuming a 90 degree ambient day how much air would you have to blow across
> the board to prevent the heat from building up enough to melt the solder.

Not as much as you might think, an amplifier with 2 devices and a 4x6 or so board will be cooled more than sufficiently with a 2 inch fan, FOR THE AVERAGE PERSON.....

> The best that conventional cooling setups can do is help reduce component
> failure.

Not true, after installing 2 fans, the 2970 i ran Never even came close to reaching the temperature it did when the solder melted... 1 cooling the heatsing the other creating an internal airflow, also built a custom shield cage around the amp board which allowed airflow... I cannot give you an exact temperature that my 2970 melted the solder at, however I know (by touch) how hot that thing was when it melted..... It was hot enough to blister skin! The temperature was reached by myself, I was in a heated discussion with a couple of fellows in Texas on LSB .505, The 2970 did in the neighborhood of 200 watts... it took about 15-20 minutes of near constant abuse to do it..... I was quite disapointed! The next day I put the radio on the bench, thinking I would need to replace the 2290's, pulled it apart and noticed a LARGE drip of solder shorting the output transformer.... removed the glob and the radio was back to 100%.... After that I installed the fans, radio could talk as hard and long as you cared to, temperature would max out below where the heatsink would be uncomfortable to the touch... This is a real world example, NOT THEORY, NOT SUPPOSITION..... The 2970 was mounted in my truck, ambient temperature range would probably had maxed out around 110 F.

If the board is getting hot enough to melt the solder there is more
> heat than a couple of 3" computer fans can take care of.

I NEVER stated the BOARD was getting hot enough, My statement was that the Input/Output transformers were reaching a temperature hot enough to melt solder! And in the REAL WORLD a single 2 inch fan mounted directly above the transistor/s IS ENOUGH to stop the problem! This fact you can debate as much as you like! IT HAS BEEN MY EXPERIENCE, it has cured the problem from EVER RECURRING in a number of instances! These ARE the FACTS!! I have no reason to BS! my experiences have proven these statements! If you have different results, or opinions, it still DOES NOT change these FACTS!!!!

The best thing we could all do is to just ignore Charles and his web site. All the replies and confrontations are giving him exactly what he wants, angry replies to his baits only raise his feelings of self. Sad, but many people can not feel a sense of belonging unless their actions stimulate a response in others. He will act calm and try to further the confrontation, when someone gets angry he feels he has WON. Don't give him what he seeks.....ignore him.

Cbnewbie,
If your going to 'permanent' mount the antenna there are three steps;
1. Drill mounting hole.
2. Route cables.
3. Clean up the mess.

How and where you decide to mount the antenna is your decision. If you mount it on the roof, it depends on how 'nice' you want things to look, but I don't think I'd cut/drill through the 'head-liner'. Take it loose(if you can figure out how), route the coax down one side(?) so that it's not too 'ugly'. Then plug everything in.
As to the 'pros' and 'cons', it's usually 'better' to have a permanent mount than a 'temporary' one, the antenna doesn't get 'lost' as often. The other side of that is that if you do much 'off-road' stuff, you may still loose the antenna, and have a hole in the roof. So... Have fun.

Ben, In all seriousness, lets take up with each other personally and not on this newsgroup. I whole heartedly agree with the ones who feel that this is BS. I felt like it was BS to start with and you were doing nothing more than trying to start a hate thread. Yes, I gladly took the bait as trolls need to be delt with. I could not imagine getting on a newsgroup and insulting a whole group of people by starting such a ludicrous thread! Yes, calling someone a socialist is extremly insulting, especially to those who happen to be very consertive. Nor could I imagime walking up to a WW2, Koren war, Vietnam War or Desert Storm Veteran, who happens to be a ham (or Freebander) and calling him a socialist. Nor could I imagine calling someone who served our counrty a socialist. Yes, socialists need to be delt with and I for one would fight to keep us free, even at my age. E-mail me directly Ben and I will argue this issue with you until one of us quits or is dead. This really should have been my first posting but at first it was very laughable...after all, how serious could a troll be? I hope I have not insulted but one on this forum and I appreciate the bandwidth. Ham call info can be found on QRZ.com and my name is John. The e-mail address here is ae4en@earthlink.net

blowing would since you would be blowing air that is hotter than the temperature of the the ice .. The ice would also melt just sitting big difference..but with a heatsink its ambient temperature is much hotter than the air you are blowing or sucking onto it . ..

I think a few have missed the boat on this one... If you suck air from outside and blow it on top or into the amp it is the same air that you would suck thru an opening and pull across the heatsink .. The real answer is either blowing or sucking the air will work as long as the ventilation holes are positioned so that the heatsinks fins are having air blown, or drawn thru them not just a fan blowing on top of the sink ... you need a sealed case with vents for outlet and inlet airflow... Let me also say this real slow for the non comprehendiable type blowing air onto the pills/circuit board is like pissing in to the wind .. you need to cool the heatsink to remove the heat from the transisitor

If the fan had to stay the same distance the pressure side of the fan would be more effective. A rule of thumb is the pressure side is approx twice the vacuum side. This will vary from fan/blower designs. Also the fans design concentrates the air on the pressure side making it more effective in your scenario.

Regarding the professors answer.....even in a sealed box the pressure method would be more effective due to the efficiency of the fan.

In looking at some of the amps especially the smaller ones 2-4 pills there
is probably 30-50 percent more heat sink than is useful. But it is a
conveinent base for the board. The professors design with the longer fins
directly under the transistor is more effective than a short fin 6" away
from the heat source.

Yes, his early books, (pre-ban), gave details on cellular mods. Given that some scanner marketers blocked cellular coverage before it was made illegal by Congress, there was certainly nothing wrong with him publishing these mods.

As for why I posted it to the SAME newsgroups you posted to, I used the reply group button. You posted your inflammatory statements to all those newsgroups, I answered them so the same people could see the truth.

What do you mean, couldn't be matched.

wattage in = wattage out X db gain of amplifier.
lower drive = lower output
too much drive = blown transistors (pills for your new tekkies)

well Ive got this really nice set of custom earplugs with speakers built
into them and they work great!
If I remember they cut over 95db out outside sound....
you can set any audio device to its lowest setting and still hear it while
doing highway speeds on a sportbike :)

so I really dont want to scrap em...

ive seen these mics used by fire crews, and I think the army.. just can't
find a source for them....

cummon someone must have seen them someplace ;)

Scott.

Hello Wayne:

Mods, just get a bigger antenna, The PDL II will work great.

Assembly the antenna dead nuts per the assembly instructions.

If possible, don't allow guy wires to close the antennas loop wires. And
if the antenna installation needs guys wires close, use a none
conductive guy line.

Hello Smokey Hill Mobile 333:

Suggest you use a stock regulator or what ever Leece uses, to start
with. And that you find someone who has a adjustable voltage regulator,
and see if thats what you really want.

I agree with Programbo5 here. Its probably is a hole lot cheaper the buy
one, and figure out what you want, before you attempt to build your own.
Good call. Building your own would take quit a bit of looking into, and
ah figuring out what is needed to make it work. But can be done.

Hey man, being that you are into Rail Buggies like I am, give me an e mail,
I will either email you a schematic or we can do some horse trading. I have
a regulator and need a carb for my 1835cc.

Our new version QF4 will be released very soon. The new version of QuicFix does not require registration. I believe that is what you are referring to in this post.

A hardware lock is used for security in QF4. QF4 ships with 2 CDs containing the program and several CB repair videos. Those interested in more info can get on the mailing list at http://www.efjdevices.com We will email you when the new version is released.

He was inimitable, surely. I never met him but I have fond memories
of him in the old Fidonet SHORTWAVE echo. In fact, I got published in
his old newsletter "World Scanner Report" (March '92 if anyone's
keeping track.) One day, I posted my Carpet Loop plans on the echo,
and Bill was so taken by my plans that he asked my permission to
publish them if I would draw a schematic for him. I did, and he did.
I was delighted!

I know about his freebanding history--it was the subject of many a
flamewar on Fido. I don't care. Even though freebanders and hams are
supposed to be natural enemies, I could never hold that against him,
not when he worked so hard to develop mods for so many of our favorite
radios. Not when he got indicted for having a device (a data slicer)
that *I* own myself (otherwise known as a HamComm decoder!)

>Hey Bill! What freq's does St Peter
>use at the Pearly Gates ? - thanks Bill we miss ya!)

Rest assured that neither the FCC nor the CTIA will bother him again.

R.I.P., Bill

Take care,

Dave

>I put a fan in my Palomar 225 amp and it blows the air into the cavity where
>the transistors are mounted. Is this a good idea or should I have it
>sucking the hot air out of the cavity? Any thoughts on this?

The rule of thumb I use is simply this: With "Valve Amps" (Tubes) suck the air out, with transistor amps, blow the air in. You see, in a trans amp you need to keep the "pills" and heat sinks cool, and with MOST "Valve amps" the entire RF deck should be kept cool, and usually a GOOD "Valve" amp will have a vented or louvered top......this is a "functional" addition it sucks cool air in through the top, and likewise blows warm air out....constantly circulating the flow of air. hope this was helpful, regards, Frank in CT.

Yup my 225 dropped the output transformer clean out when my cat knocked the D104 over and managed to key it down for maybe 4 hours. I was mobile and started wondering who was deadkeying and as I got within a black or to that jack off unkeyed - Oh that jack off was my cat :)

sorry wild i emailed it to you.

i have to agree i have seen a few long winded sucker whos amp was placed in the horizontal or upside down position have the solder melt the solder clean off the board, it looked like stalagtites and stalagmites of solder hanging . it didnt help that the one of the 2 fans wasnt working ... fixed the fans and he still stays on the maul but no solder melting problems

here would be my choice of the three!

1. 2950 (reason all ready to go the full 11 meter spectum and the one I use)
2. Galaxy (reason I like the looks BUT not modded for "freebanding" as easy as the 2950;))
3. Cobra (hey after all it still is a Cobra..just I do not like all of that added crap like soundtracker which has given me fits!)

Good luck in your choice. And once you make it do not look back.

I do not know where you have been looking at to buy the radio. I have had great luck and have sent many people to www.exportradio.com. They are really helpfull and friendly. Notice I did not say CHEAPEST! Some cheapest equals piss poor or NO customer service or support. Which to me is very important! I am a dummy sometimes and need to reach out and touch someone!!

Of your 3 choices my personal choice would be the 2950, however you might want to take a look at the Deltaforce magnum, its a great radio, 25-29 coverage when modified... lotsa toys, Super talker, recieve is a bit noisy but the radio is great! My first choice was always the RCI until i tried the Deltaforce, $250 or so is going price... here is a link to look the specs over....

The 257 is also pretty decent but lacks the features of the Deltaforce...

4069. A first CB radio

Newsgroup: rec.radio.cb
Date: 2000-07-28 00:00:00 UTC
From: deptdept@my-deja.com
Message-ID: <8lsheu$r7l$1@nnrp1.deja.com>
Source record: 46049

I'd like to pick up a radio to try out CB, partly in my car, partly at home. My thought was to get something inexpensive ($100 or under) and portable (handheld) to get started. If I find it's a hobby I really enjoy, I'd think about better equipment later on.

My question is: will a handheld work inside a car without the aid of an external antenna? How about at home (without an outside antenna)? If not, is there some sort of easily mounted (magnetic) antenna I could use with a handheld, or do they generally not accept externals?

Any suggestions greatly appreciated!

> Pro520XL tomorrow as well. I also bought some stranded 10guage wire to
run straight to the battery.

I wouldn't go straight to the battery, the acid will corrode the connections
fast. I would follow the positive wire from the battery to the starter
solenoid and attach it there. Less hassles. Fuse it close to the source
also.You might need to put a heat shield on the wire if it is right on the
starter. Some automobile manufacturers mount it up by the battery.

> All I need now is CAPs. For isolating the CB from
> the rest of the car, what voltage and pF cap do you think I should get?
> also. what type. thanks!

You are using it in a 12 volt situation, so I would doubble that to 25 volt
rating caps. I would try 470uf or a 1uf to start with. You can always go
smaller. Also, you could put a coil or ferrite beads in series with the
power line to block the ac that gets by the caps. Important: put these
after the fuse.

Getting cheaper equipment may cause you to not enjoy it..Most hand helds are`nt too good.....I`d try and pick up a good used high quality one off Ebay or something over a new cheap one..No matter what radio you get find a good tech and get it peaked and tuned since all radios straight from the box have low output because of FCC regs

I hope I did`nt brain my damage.

No because most, if not all handhelds don't have a noise blanker.
A noise blanker is a must. It blanks out ignition noise that come from
your automobile.

>How about at home (without an outside antenna)?

Not even close to the effectiveness of an external antenna.

>If not, is there some sort of easily mounted (magnetic) antenna I
>could use with a handheld, or do they generally not accept externals?

Sometimes they will have a external jack.
>
>Any suggestions greatly appreciated!

Buy a standard NON handheld unit. You'll get more radio for the buck.

4076. Re: Blowing the air in or sucking the air out?

Newsgroup: rec.radio.cb
Date: 2000-07-28 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <rElg5.38486$qS3.78311@tor-nn1.netcom.ca>
Source record: 46056

I would say have it suck the air out. Also, see if you can make a small hole(s) on the other side of the case, so that cool air is pulled in through the hole(s) and out via the fan. This will improve the cooling efficiency. Try and place the hole(s) so that a fairly good path is created to the fan so that the air will flow over the transistor heatsink cooling fins. All
computer fans are configured this way to expel hot air.

However, maybe somebody else in the group could verify if making holes in the metal case is wise. I am unsure as to whether it will affect any shielding or emissions.

I am considering adding a fan to my PC122XL to try and compensate for the thermal drift on SSB after the car has been parked in the hot afternoon sun.

Richard.

Take a volt meter and measure the batter voltage during keydown conditions. If it drops a lot, you need more regulation from the supply. They're not hard amps to work on, I have one or two myself now. Put it into a dummy load for your first tests to get the truth about what the amplifier is doing. I wouldn't drive it with more than 4 watts am carrier.

Email me direct if you have specific questions.
cheers

: Let start a thread about tying in the screen a bias on these tubes and how
: to do it.
: KRS

large tetrodes often have the cathode placed below chassis ground and the screen grid at dc ground. Split supplies are easliy enough done. For traditional designs, the screen grid is regulated with a low impedance shunt regulated supply. Provisions are made to ensure the screen supply in never povided without the plate voltage present.

Most of my tetrode designs feed the - bias to the control grid right through the tuned input.

this radio is 5 band:a-e, ssb,approx 8" wide and 9.25" deep
without measuring the knobs or heatsink. it was serviced years
ago and looks as though the tech soldered a bit here and there.
but, i've used it and enjoyed it for years off and on. only
radio i have.
problem: it listens very well but on transmit it is off 200 to
400 kc from what others tell me. radio does not have a frequency
read out.
is this radio worth fixing? i was giving thought buying a new
rci 2970 or something. i would rather keep the jackson due to
the infrequent use. also, if i bought the "photofacts" (if they
exist) could i adjust this myself? the repairs would be close
to $100 if i send it out.
but if it's just junk i would like the ng's honest opinion.
thanks. tony, oregon.

Well... then the fan blowing on the cube is more efficient because the stream of air is directed. The input of a typical bladed fan is not nearly as organized. After all... that's what a typical fan was designed for... to blow a stream of concentrated air. The intake of the fan was not designed for this type of flow.

The problem with bigger amps(more than 2pills) is one of expense, reliability, and don't forget being practical. My 2pill will put out 180W RMS on AM. This is more than adequate for talking around town and shooting some occational skip. Remember that transmitting effectivness is not a linear function of power output. If you were to put out 360W... you would NOT get twice the distance from 180W. You may only really increase your effective range by perhaps 25%. My opinion is that this additional power is not cost effective. As far as I'm concerned... these 4, 8, etc pill amps are for competition only where cost and reliability are not an issue.

Hi
If you keep the small clefier in the 12oclock position and use the outer clefier to tune the station
you want to work on SSB it will work just fine, on AM you won't be able to tell if its off at all.

The radio can be fixed easily. it's just a matter of having a 12 volt supply with a dummy load and a frequency counter to measure your transmit frequency. then making the proper adjustments to realign the radio. If you want get a hold of me email and I can fix it for you and let you know what it will cost. but i guarantee it won't be no where near $100.00 more around $40.00 including shipping back and forth.

If you are going to buy a handheld to see if you like the hobby save your
money. You will get no where with the hand held and will put it in a drawer
real fast and forget about it.

I want to add a linear amp to my rig in my truck. I use the unit mostly to communicate with others in my county (20 mile or so area, not much into skip). Just looking for a bit more range. I found on a web site, Left Coast Radio I think, a Palomar 80 which the site promotes a good solution for a mobile set up with out a lot of drain on the electrical system. I am new to linears and was wondering what I might expect in performance enhancements. I know terrain and other factors can make a difference. Any help the group can offer would be appreciated.

I would agree, hand helds aren't a good starter radio in any radio service. Get a mobile unit and a mag mount and try that out. You will have to decide on what you want it for also. Do you want to listen to the truckers, talk in your local area or to 4wheeler/hunting buddies, or talk to people all over the usa/world?
Most any stock 40 channel am will do, if you want it for traveling / road reports / hunting parties / local stuff

If you want to talk more than 25-30 miles, get a more expensive 40 channel SSB unit, they have more power on ssb and can talk farther. As for taking it to a teck and having them peak it for an extra 30-40 bucks, I wouldn't waste my time on that yet. You can do that later. A stock CB with a good antenna and the right conditions will allow you to talk to all 50 states and canada.

If you want it for mobile and base, a stock cb only requires a 3-4 amp power supply and they run pretty cheap (30-40 bucks).

I'd go for it, 80 to 100 watts am carrier is a good size mobile amp to start out with, and like you say, won't be too hard on the electical system. If you run SSB, that will put you around 250+ PEP ballpark. Nice mobile station.

Think of it this way, there are 6 db per S unit on the RX scale.

If you buy a 10db amp (4 watts to 40) you will go up approximately 1.5 S units on the other end. If you go 13 db gain (4 watts to 100) you will go up approx 2 s units on the other end. If you go up 20 db (4 watts to 400) you will go up approximately 3.5 s units on the other end.

The antenna is 1/2 of your radio system, if you can upgrade your antenna s ystem you might gain some preformance out of your system too. Bigger is Better usually.

I have run a 100 watt linear in the mobile and it usually made the difference between talking and not to a base 30-40 miles away. (no skip on a clear channel) That is all most people need to get above the noise level unless you are on a channel where they are having a power war with 1000+ watt linears or there is someone else stepping on you on purpose who has alot of power. Most people are civil and are just trying to make contacts and see how far they can talk.

Not a whole lot of dollar difference between an 80 to 250 you can go to a 350 without much strain on your electrics. The 350 Cobra Blue one is a good amp. The antenna and grounding of the radio amp and antenna become more critical as the power increases.
"Rosco" <rvaagen@hotmail.com> wrote in message news:so4gb0iho0b24@corp.supernews.com...

Why don't you get a Uniden Grant XL they are available on the uniden site
for 132.00 same chassis as the older Cobras. Of course it would have to be
channeled and tuned by a good tech and that should run 50-60 dollars. If you
shop around you can find the RCI for about 250.00

No it was pushed beyond its limits or into a poor antenna system. Built to the proper service specifications any device can handle the operating conditions. But when your circuits, wires and other components are rated for 12 volts and you hit with 20 without properly upgrading the design it will melt. Question is will it make it through the keydown before it fails. Risk Vs Reward.

The handheld in the car picks up to much electrical noise. So then you head down to the Shack and buy one of those cheap 20.00 mag mount antennas. Then you plug into the cigarette lighter because batteries cost a fortune. Then you realize you have a spaghetti bowl in your car and you say to your self this sucks.
Then you go to www.uniden.com order a 66 or 76 find a dealer on the web and buy a Wilson 1000 mag mount for 60.00 and now your talking and listening too. In the meantime the handheld is gathering dust in the closet.
Been there got two GE handhelds in my closet.

I saw a device in one of those home improvement junk catalogs that connects to the a/c vent on the car and has a 3" hose with a fan at the other end. It was intended to allow cool air to be directed to the back of the vehicle. But it looked like a good way to get cold across the heat sink of an amp and that would be far more effective then a couple of 3" fans blowing warm or hot air. Of course if a Leece resides where the A/C is suppose to be then your SOL.

news:8lthab$hhb@journal.concentric.net...
> No it was pushed beyond its limits or into a poor antenna system.

Man dewd, are you dense? I've already said they were ALL run hard!!
Antenna system IS NOT an issue in the cases I'VE QUOTED!

Built to
> the proper service specifications any device can handle the operating
> conditions. But when your circuits, wires and other components are rated
for
> 12 volts and you hit with 20 without properly upgrading the design it will
> melt. Question is will it make it through the keydown before it fails.
Risk
> Vs Reward.

Again, this is old news!! I typically DON'T run over 15 volts.....VOLTAGE
WAS NOT AN ISSUE in the examples i've given......

Bottom line IS the solder CAN and does melt in a solid state amplifier,
and it doesn't need over-voltage, improper load or component failure for it
to happen....

I seriously wonder why you've even chosed to have a debate with me!
There is nothing to debate! It happens, and in every instance i've had it
happen cleaning up the solder puts the device back into service!! And a
simple fan has prevented the problem from recurring!!

Perhaps if you created a larger amp like a 4 pill or even an 8 pill design Brian, you might then need a fan. What do you think? Is your design so efficient that even at 8 pills you would not need a fan?

COLD as ICE and TWICE as NICE.. Mr. ICECOLD BIG APPLE TREES says.. It don't mean a THING if you ain't got that SWING!!!!!!!

Hello,
The HD in most cases stands for High Drive,
Meaning it will handle a nice drive, say 10 watts or more.
You may not have enough drive watts from the Grant to get the full power from the amp, but you should get some decent power out the end if you take and peak the grant up some with 100 % modulation.
Hope this helps...

You might double check the SWR on the antenna, sounds like your getting some RF leaking out that you may not have noticed with a less powerful radio.
Then try grounding the radio better and closer to the radio.
Hope this helps...

Usually when you find one the tubes are bad. If it will do 20 watts everything
else is probably good. If it does not put out anything there may be other
problems.

What ever radio you decide on, wether hand held or not.
Make sure you get a decent antenna, because your antenna plays a very important part and can turn a 100 dollar radio into a five dollar item real quick.
Do some looking around for some good deals on antenna, such as K-40 or Wilson, these 2 antennas are great.
Hope this helps...

>
> Sucking the air out.... To get an idea of why I say this take a
glass and fill it with boiling water and then stick it in the freezer
for about an hour. You'll come out with a cracked glass because of the
sharp drop in temperature. That's the same thing you're doing to your
transistors when you blow air on them. They're supposed to get a little
warm, but if they get too hot you can crack the substrate if you cool
them off too quickly. This normally happens after the amp is done being
used (or bettween transmissions)and the fan is left on. I'm not a
technician but have had the same homeade amplifier for the last 5 years
with an EXHAUST fan on my box.

Get the most expensive radio you can find. Borrow money if you have to and then get it 'tuned' by some guy who says he has been doing this for over ten years. Now, buy all the sound toys you can find and get an echo mic. Take out another loan if you have to, but be sure to get that echo mic. Now, find the most expensive amp you can get and buy that up as well. With all the crap put together, nobody will ever be able to understand you let alone know who you really are. Yep, that's communication, genuine CB style.

reroute your wires. your could have the coax for the cb and the
coax for the sterio running side by side some where...if that
the case they will induce into each other. also it could just
be a poorly made sterio/ no help for that.

Message-ID: <8luqf9$4diu$1@newssvr03-int.news.prodigy.com>
Source record: 46137

In any handheld the small speaker and the inefficient antenna will frustrate you almost immediately. Handhelds are good for such things as talking with nearby friends while hiking, or fishing.

No radio - handheld or mobile will work well inside a car without an external antenna. Ignition noise is part of the problem. The other part of the problem is that the metal car body is a vary effective shield, keeping your signal in, and other signals out.

Even at home, the stock antenna on any heldheld is inefficient. You will not be happy if you don't use an external antenna, unless you are talking to someone very close by.

Some handhelds have removable antenna. In which case you can remove it and connect an external antenna. If you do get a handheld stay away from the ones with fixed/non-removable antennas. If you get one with a removable antenna try to be sure it has a standard connector (probably would be a bnc, on a handheld cb) If your connector is a non-standard type (even a tnc) you will have to buy adaptors or do surgery on your co-ax to connect it to your radio.

Your tech sucks

Any radio can be matched to a linear

I HATE the fact that they use 4 pin mics now. The 5 pin kept the audio chain isolated from the radio common ground. You will see a LOT more squealing problems with those pieces of shit now.

I usually pull the first driver tube out of those amps anyway.

That makes the EXPENSIVE (hundred dollars a piece) 8950s last damn near forever, and makes it REAL hard to overdrive that thing....

A peaked up radio will still net you 200 to 250 out of it, and that is what it was designed for.

It is a 16 device (2879) amplifier, closely copied from the original
Messenger Competition 2Kw design, but the chassis is different.

They are decent. Not the best, by far not the worst.

I wouldn't give more than 600 for it, in decent shape

The SommerKamp 2Kw was the same amp.

No, it isn't.

Spreading information, with the intent to help others gain knowledge is one thing.

Selling drugs is another.

You think that someone who is doing 56 miles an hour in a 55 zone is just as bad as the one who sells drugs to your daughter, too, eh?

I would hope so, you hypocritical ass!

Hello Gary: You always seem to have a smart a$$ thing to say.

Haven't you read the ARRL Handbook, "The Amateur's Code". Look this word up its in then "F" section: "Friendly:

"FRIENDLY... slow and patient operating when requested; friendly advice and counsel to the beginner; kindly assistance cooperation and consideration for the interests of others. These are the hallmarks of the amateur sprit"

And now that we is ah gettin CW out of the way, so that we can use the other channels on our radios, 160,80,40,20,17,15,12, and 10, You might want to brush up on your Ten Codes.

Jay in the Great Mojave Desert, ...just down the road ah ways from the fillin station.

If you suck it or blow it the air temp is the same. The whole question started based on the air being drawn through or blown into the box. The consensus has been to direct the air across the heat sink for best efficiency.

Just received a Galaxy 949 I ordered from exportradios.com.
I had them do their "turbo tune" on it, their website claims 30 watts with this done.
Now the radio has a power meter function on it and when I check it on AM it reads about 5 or so......when I check it on SSB it reads about 12.
Now correct me if I'm wrong, but I think those are about the normal power levels from a stock radio.
So did I get screwed in the "turbo tune" or doesn't it show up or what?????

Thank you

>Send whatever you can to:

Sir: The average american family has approx 3 credit cards with a balance of at least $1000.00 on each. Plus a mortgage or rent of an average of $750.00, this does NOT include the basic essentials of food, car payments, misc monies, Are we ALL NOT IN FINANCIAL NEED ??? I will 110% agree with the fellow who told you to go down to your local fast food place and fill out an application, I think MOST of us out here have had more than one job one time or another in our lives.....for various reasons. I dont wish you bad things BUT lets get real here, get your rear-end out there and get another job. I have NUMERIOUS health problems, and My wife and I seem to manage some way or another.....(we get by) I wish you well, especially your family, Regards, Frank.

Few questions to clarify things here

Were you modulating when you took the readings?

What was your SWR?

What meter did you use to take them?

All these things make a difference on the power reading you receive.

--

Trying to get a foot in the door and have
some good sounding long distance
fun in this great hobby

Now I will shutup, listen, and hopefully learn.

Ok here are a couple of problems with what you say you were looking at.
1. The s/rf meter on the front of the rig is for relative output. There are very few rigs and all of the them are amateur that have even a what might be called an accurate power meter built into them. Get an swr/ power meter.
2. You do not know your SWR. About 1.5:1. Get an Accurate SWR/PWR meter.
If you need a meter I have one or 2 for sale cheap and its accurate.
Email me or IM me either one and good luck.

for starters if you haven't already had it done take your radio to a cb shop and have it tuned and peaked. That's the first thing and smallest improvement you can do but it's also the cheapest. Then if you want more power for even farther range try looking for an amp at the same cb shop you tuned your radio at or look online at places such as http://www.exportradios.com

How will that give you more "punch" I got a ticket and still can't reach any farther than before on my CB. Or did I get screwed and not get the "magic" one that transforms my radio into a 200kw broadcast station.

>
> get e better radio , and amp . that it

I would agree with that one. but the radio can do if that's all the features he wants.

Let me offer another opinion. The best radio, for this beginner, I
think, is a Handheld. I like the Cobra HH45WXST (discontinued) but
has numerous clones like the http://www.bills2way.com/equip/ah27f.html

We all agree that regardless of what you use, you need a good antenna.
So what you hook the antenna up to is largely irrelevant as long as
the basic unit has good transmit and receive.

Plus, with the handheld, you have a great walkie talkie.

That meter is not measuring actual power out. It is only a relative measurement. You will need to buy a good power meter and run into a dummy load to get a good reading. Your best bet would be to take it to a local shop and have them put on their meter. A good shop will do that for no charge.
Export radios has had a good rep so I would think they did what they said. A slip of paper with the readings carrier and modulation should have been included as each radio will vary in its output.

Kenwood TS-680S All-mode HF + 6M transceiver, great condition. $575.

Drake R8 Communications Receiver (considered one of the best) $550.

Icom IC-275H 2M All-Mode (100 watt model not the 25 watt 275A)
$575.

Realistic TRC-449 40 CH SSB CB with the famous PLL that can
be modified. Radio bought new, used once and then stored.
Never picked at and still original. $200

ICOM IC-720A HF TRANSCEIVER WITH GERERAL COVERAGE RECEIVE $375.

Icom IC-720A HF Solid-state Transceiver with General Coverage
Receive/All band Transmit $375.

All Prices include shipping anywhere in the USA or Canada and
are in US dollars.

In the US, you can't make such a claim until you've done a thorough
reading of both Title 47 CFR Part 15 and the Type Acceptance standards
that the FCC imposed upon the manufacturer of a particular brand and
model scanner. Without a fully-equipped lab, you have no idea if
the modification you've performed keeps your scanner within the limits
of the Type Acceptance boundries.

Just giving your scanner more channels might have an adverse effect
that you're not even aware of, yet could be causing havac with other
spectrum users.

Jeff

Yes...it is an earlier one. I should know...i sold it to him over a year ago! It was mint then. I got it from Stewart's Electronics. Paid $320 for it. If you open it up...it has a full sized resistor installed for the channel modification instead of a surface mount. Whats that Varmint? You should have known better.

>put you around 250+ PEP ballpark. Nice mobile station.

The amp in question is a Palomar 80, not a 225. The 80 has one MRF455, a 60 watt
transistor. If you drive it so hard as to get an 80 watt carrier out of it, it
WILL burn up. I would set it to dead key about 20 to 25 watts max.

Hey Ed, the first 10 times increase in power output is the most efficient gain
you will get other then using a better (higher gain) antenna. To be twice as
strong as you would be with the Palomar 80 would take a 4 device amp. Expect
each MRF455 to draw about 10 amps and an MRF454 or 2SC2879 to draw about 15 amps.

Doesn't the Galaxy 99 have that stupid un-understandable robot
voice? Since most people's radios are driven to over-modulation,
what's a lot of echo between friends? Those folks are the ones
that make AM mode suck. They will always go to 36-40 and talk.
I like when they complain about the sideband when I CRANK IT UP
just to f*ck with them 'cause I'm already there.

>No, it isn't.
>Spreading information, with the intent to help others gain knowledge is one
>thing.

Without a fully equipped lab and the expertise to use it, you have
no idea if the modification you make to your radio will have an
adverse effect to other users of the spectrum. Your scanner is
covered under the CFR Part 15 regulations as an unintentional radiator,
and it DOES radiate RF. There was a case where someone's unattended
scanner was radiating enough RF to lock up a repeater some distance
away.

An innocently done "mod" to your scanner might cause havoc to any
of a number of radio services; in particular, if you reside near
an airport, use special care with what you do to your radio(s).

The GM's I've seen all have the positive wire going directly to the
starter, underneath the car. I use the top posts on my dual post
battery, the car connects to the side posts.

I use large copper lugs and solder them on after crimping and always
use star washers. They keep it conducting and they keep it tight.

> Steve

Steve,
Guess it just depends on 'how' you want to operate the Drakes.
I think the 'transcieve' method is best, perwsonally. If you
don't mind 'zero beating'(bothersome), a second crystal would be
required. Also, just for 'insurance', the second crystal may not
be a bad idea. If one 'craps out' on you, you'd have an option
to keep operating. As far as one being 'better' than the other,
that's just a matter of opinion/preference. Keeping both xmtr
and rcvr on the same frequency, especially on SSB cam be a real
'pain', that's why most manufacturors went to trancievers.
'Doc

Thats good if you are just sitting in one place but try driving around with a 102" up on your roof

I hope I did`nt brain my damage.

Normally thats true but the first CB I had was an old GE handheld back in 1976..It had hook ups for a base mike,external coax ..It had a 6 foot center loaded antenna and used about 12 AA batteries..That thing got out!!..Had to replace the batteries every few days..But it kicked ass!

you don't need to be a HAM to get out futher....I've been a HAM
for 35 years and am an extra class...(with high speed code) and
I say all you need is the right band conditions....1 watt will
talk around the world when the conditions are right...I have a
card from s. africa that I worked with LESS than 1 watt....
believe me , I have that card framed....

I bought my Dx99V from them with turbo tune and it works great.
Just hook your radio up to an swr watt mtr and you will get a better
reading.
and if you still feel you still have problems call them they are more than
will to help.

Put your hip into it! (just kidding)

A good antenna and modulation will do more for your signal than an amp will. Use a Wilson 5000 or a 102" whip for your mobile or a beam for your base and tune it up right. Remember, garbage in - garbage out. Forget the amp.

Hmmm, if his is an arm and a leg, what would xforces be? two arms and a leg? I've seen both up close and personal, they not only use the same components but they both are pretty sloppily built..... My reference to sloppy is the lack of any cicuit board, and the fact that the regulator IC kinda resembles a porcupine with all the components hanging in the air..... I haven't seen daves, but if it looks like these two its NOT impressive..... They are also Noisy as hell.....

Hey people..... time i post this again...... if you have any of these
items and want to part with them drop me a line....

Tnx

Any condition on the following items........

Kafs Cricket Hump mount with speaker
Buddy 23 channel CB, two piece Base
Mark Invader/sidewinder export 23 high power base uses 2 6lq6
windjammer base modulator. like jb12
23 channel base radios
old amplifiers
Liberty 200 (Gold Plated +2)
Avanti Sigma 4 (NOT COPY)
POP ROCKER (Plastic handle for D104)
UI-7 AM/FM Board for ICOM 725
PRIDE DX300 or KW1
BlackCat mobile modulator
EF Johnson Transmitters

the noise toys need to work....
will pay up to $50.00 each for the following...
they have to be made by stated manufacturer.....

_____
NOISE TOYS

_____
tweety bird (DJ Electronics)
space bird (DJ Electronics)
agitator (MR. JIGGS)
agravator (MR. JIGGS)
undertaker (MR. JIGGS)

I do have the radio chassis grounded, and the ground is a good one. This radio is installed in a Peterbilt and there is cell phone coac in the and some coax for a shop radiom any suggestions on what I could shield them with? Ill even go back up in there and try to seperate them. Not a lot of room in those overhead consoles?

4267. Extra channels on a 148f GTL? how?

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: notdareal@aol.com
Message-ID: <20000730190843.11692.00002100@ng-md1.aol.com>
Source record: 46151

OK, I got the 148F gtl (Has a freq. counter built in). Anyone know any websites that can show me how to add extra channels to it? Also, the TX clarifier mod would also be great. If you don't know of any websites, maybe you can email me instructions on what to do. I found websites on the original 148, but nothing for the 148f GTL, which I hear is different. I recently modded a 148 which looks similiar inside, but I'd rather be safe. Thanks. This group is always more than helpful.

4268. Aww Shit ...

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: The Game <TheGame@yahoo.com>
Message-ID: <JF2h5.189$ck5.3787@news2.voicenet.com>
Source record: 46152

Shit . . .

Shit is a powerful word. Just think of all the concepts and ideas you can communicate with it. Shit may just be the most powerful word in the English language.

Consider: You can be shit faced, be shit out of luck, or have shit for brains. With a little effort you can get your shit together, find a place for your shit or decide to shit or get off the pot. You can smoke shit, buy shit, sell shit, lose shit, find shit, forget shit, and tell others to eat shit and die.

You can shit or go blind, have a shit fit or just shit your life away. People can be shit headed, shit brained, shit blinded, and shit over. Some people know their shit while others can't tell the difference between shit and shineola.

There are lucky shits, dumb shits, crazy shits, and sweet shits. There is bull shit, dog shit, cat shit, bird shit, whale shit, rat shit, and horse shit. There is tough shit, hard shit, soft shit, slimy shit, rough shit, limp shit. You can shit a blue streak, shit bricks, shit pink twinkies, shit marbles, or shit your guts out.

You can throw shit, sling shit, catch shit, or duck when the shit hits the fan. You can take a shit, give a shit, keep shit or serve shit on a shingle. You can find yourself in deep shit, or be happier than a pig in shit.

Some days are colder than shit, some days are hotter than shit, and some days are just plane shitty. There is funny shit and sad shit, bad shit and good shit. Some shit doesn't stink while other things really smell like shit.

Some music sounds like shit, things can look like shit, and there are times when you feel like shit. You can be faster than shit or you can be slower than shit. Sometimes you'll find shit on a stick, sometimes you'll find shit everywhere, and then there are times when you can't find shit at all. You can have too much shit, not enough shit, the right shit, the wrong shit or a lot of weird shit..

You can carry shit in a bucket, put shit in a barrel, have a pile of shit, have a mountain of shit, have a river of shit, or find yourself up shit creek without a paddle. You can slice shit, spread shit, dunk shit or jump shit, and some people just can't cut the shit.

There is fun shit and dull shit, silly shit and serious shit. Sometimes you really need this shit and sometimes you don't want any shit at all. You can stir shit, kick shit or stick your ass out the window and shit on the world. Sometimes everything you touch turns to shit and other times you swim in a lake of shit and come out smelling like a rose.

Shit! When you stop to consider all the facts, it's the basic building block of creation. This means the universe did not begin with a BIG BANG but rather with a BIG DUMP. Keep that in mind the next time you flush the toilet. And remember, once you know your shit, you don't need to know anything else.

I know this sounds silly, but get some brake parts cleaner from an auto parts store. The stuff will take any thing off but metal and plastic. Works great. Just make sure to dry it off afterwards, I'm not sure if it conducts or not.....

Message-ID: <3984C1E1.7BF41DDF@island.net>
Source record: 46161

The Galaxy 99 is a 10 meter radio, so it
has to be converted and realigned.
You will get splatter if the following
functions are not done with the right
equipment...
1.VR 1....AM/FM S-Meter
2.VR 2....SSB S-Meter
3.VR 3....SSB Squelch
Range
4.VR 4....AM/FM Squelch
Range
5.VR 5.....FM Deviation
6.VR 7....SSB Carrier
Balance
7.VR 8....RF Meter
8.VR10...Final Bias
9.VR11...Driver Bias
10.VR12...SSB ALC
11.VR13...AM/FM High
Power
12.VR14...AM Modulation
13.VR16...AM/FM Low
Power
14.VR20...Final Bias
15.VR21...TX Offset
If you still get splatter then the job
was not dome thoroughly or you have a
SWR / matching problem.

An amp is illegal for CB, a better antenna is probably the answer.

No... you missed what I was saying... I was simply stating getting a
ham ticket doesn't give a radio magic powers to make it perform
better. The original post was asking for suggestions on how to improve
his range etc with a CB just just range in general. So the
statement "go get a ham ticket" is irrelevent.

everyone knows amps aren't allowed on cb I was just stating possible
answers to the guys question. and on a mobile he's not going to get
much better results than a wilson 1000 as he stated he had. a 102"
whip would help but not much.

4304. Cobra 21 XLR, need some info.

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: villagevandal@my-deja.com
Message-ID: <8m0d10eqf1@nnrp1.deja.com>
Source record: 46263

My friend found a Cobra 21XLR at work in the trash and gave it to Me. It's much older than any Cobras I have owned. I have a 148, but would like to get into this one for the fun of it. Found the upd858 mod.s, looks like a nice old audio transformer, did not look up the final yet, looks weak, was hoping for a old 1302. Does anybody remember how well these tuned up and sounded? Did they have good audio. Would like to put the low freq.s in if it's a good talker like the old GE's with the audio xformer any other mod.s for this one like RX, or final section. The freq. is easy on this one. Wish I had a sams 121 to peak at. AM only, to bad, must be single conversion. Thanks.... 738

Sent via Deja.com http://www.deja.com/
Before you buy.

4305. Cobra 29NH ST Mods..

ok...what you need to do is take that radio and soak it in luke warm water
with 2.3 ounces of virgin olive oil for approx. 13 min. Towel dry it with
terry cloth and dry it with a 1200 watt hair dryer. It will "Get down"

"John Bombard" <flyboy4097@home.com> wrote
> I know this probably sounds stupid as well as disrespectful, but WHO THE
> HECK IS THIS GUY?

This question is often asked, here is the standard response below.

Bill Cheek was a man who lived near San Diego. He used to be active on
Fidonet but then had
to leave due to reasons we won't speak of now. He then became active on
this NG & the
internet but was again involved in much trouble. Various problems with Mr.
Cheek's action's
resulted in Peter Laws kicking him off of the "Scan-L" mailing list. More
similar problems with
Mr. Cheek caused him to have his internet access revoked by his Cable
company
ISP in summer 1998. In 1999 he was briefly held by (federal) authorities
and has
been charged in (federal) courts with various illegal actions in regards
sales for the use
of scanners. (He had admitted to other legal problems in the past, also) He
was the owner
& operator of a company called "Comtronics" & has produced a few books based
on
information he had complied from various sources.

Despite various rumors, Mr. Cheek did NOT have any FCC issues licenses
within
the last 15 years.

Mr. Cheek claimed to have been in the Army, others said he had been in Navy.
His
rank or billet is unknown.

Mr. Cheek was well known by many for various reasons in the radio community.
Some
people feel his technical knowledge was notable, some people feel certain
aspects of his
personality were notable.

Due to mounting legal problems followed by health problems, in 1999 a
donation request was
made to the general public to assist Mr. Cheek who had no health insurance.
His legal issues

were being addressed by a public defender.

Mr. Cheek was a smoker and died in July 2000 due to complications of Lung and Brain Cancer.

He is survived by his wife Cindy and his children.

Mr. Cheek will be missed.

Hello Killrwat:

I'd love to see one of those Export Mark Invader high power radios. I have a old Mark 27 and the 23 channel set that is transistorized, but has a 6BQ5 finial tube.

The Buddy Base's are a three piece unit, the speaker is in a seperate cabinet also. Boy does that bring back memories!

I think I have a brand new Anvati Sigm 4, but its not complete. I have a few copys of the Avanti Sigma 4, that are much better than the orginal copies that where first class junk. Just took down a copy Sigma 4, and the sheet metal screws where just starting to work there way out.

Saw a custom Pride DX-300, at the TRW swap meet. It had a seperate power supply, and used two 4CX250 tubes insteade of just one.

Well said John!!! No matter what a person thinks about someone, wou
would think that people could at least show a little respect or
compassion when someone passes on!

Great job

Garry

I think your radio is off frequency. I have seen this many times. Take it or send it to a reputable tech to have put back on frequency.
Sometimes they just come out of the box that way.

my self i stay away from amps that have built in drivers thay always give me problems but that stock grant is not going to drive a 500v right you need a good 5 swinging to 15 rms to drive a 500v to max if you get the 667 thay sound the best with less than a 3 watt carryer drive

Yes. Uniden 520XL: cheap, basic, good. However, any CB is only as good as the antenna attached to it. I spent $30 on a Lil Wil from Wilson, and have never looked back. You could spend more and get a better one, but if you're looking for basic/cheap, this set-up will do you right.

Josh

P.S. Handheld units are a total waste of money

Message-ID: <G6Xg5.15681$_G.311125@news-west.usenetserver.com>
Source record: 46297

I have noticed over the years that all the major "bootleg" amplifier companies have been what I consider a gross mistake in their power combining technique for amps of the 4pill class and above. The problem as I view it is a fundamental error in the impedance match on their 2port transmission line combiner. These are the ones that consist of a toroid with a bifilar winding, and the 100 Ohm resistor. The problem comes in when you try to attach all 50 Ohm impedances to all ports of this combiner. This type of combiner also requires a 2:1 transformation on the single port side of the combiner to preserve the 50 Ohm standard on all ports. How is it I never have seen this 2:1 transformer incorporated in this combiner scheme?

4339. Caution - Stay away from DWM Communications!

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: Newswatch2 <newswatch2@my-deja.com>
Message-ID: <8lvs9s$42f$1@nnrp1.deja.com>
Source record: 46344

To All Readers:

DWM Communications website can be found here:

http://www.qth.com/dwm/

AVOID Tiny-Tenna and buying ANYTHING from DWM communications. Not that the products themselves are bad (although many say they are!), but DWM communications is actually a terroristic organization similar to the Scientologists. If you say something they do not like publicly, they will pursue you with their lawyers, tell lies to your employer, and do everything they can to smash your reputation. Ask the folks in rec.radio.shortwave!

Take a look at the spamming going on in rec.radio.shortwave. All of it is originating from DWM communication staff. They are currently attempting to disrupt and destroy many radio-related newsgroups through repeated, malicious spamming.

The president of the company, Bill Lauterbach, entered r.r.s. for the purpose of threatening, terrorizing and spamming the group.

If you give your personal information to DWM Communications, Inc. they will most likely abuse it, and may even give it to others! This company (that makes the "Tiny-Tenna") is UNSAFE TO BUY FROM, and if you buy from them you are risking not only your money, but your sanity and peace of mind as well!

You should note that this company also advertises freely on radio stations that promote fascist and racist material and carry such programming. This makes the company a racist organization, and if you buy from them you are supporting racism!

The "Tiny-Tenna" product is simply $5.00 worth of parts that anyone could build themselves, even a child. Yet they charge $19.95 for it, making a probably 400% markup.

Take this as a warning, and NEVER buy anything from DWM.

DWM's website can be found here:

http://www.qth.com/dwm/

Their phone number is 1-517-563-2613

Their address is: P.O. Box 87-W, Hanover, MI 49241

DO NOT ORDER FROM THIS COMPANY!! You will be risking a lot, and it is not worth it! Keep your sanity, your peace of mind and your money, and

order from another company instead!

If you are wise, please contact the company and let them know how you feel about the spamming going on! And above all, avoid ordering from this company at all costs! It will be the biggest mistake you have ever made in your life!!!

My personal views of Scientology aside, I will say that the original post is quite a bit misguided. I am a regular user of the r.r.shortwave newsgroup, and of course I deplore the TT spamming... but as far as I can find out, it's coming from moronic individuals acting on their own lunatin abusive whims. DWM is not the source for these intrusions.
On the other hand, DWM, and specifically Bill Lauterbach, haven't done much of anything to help the matter. They know there are problem people in the room who are smearing what would be an otherwise decent reputation in the small accessories market, but seem to roll over when it comes to disassociating themselves with such morons.
Sure Lauterbach will get huffy when some SWL's say anything negative about his product, but he says nothing when someone asks him to publicly disavow his abusive and intrusive "supporters". It's a pretty crummy way to conduct a business... BUT the majority of such annoying posts are not from DWM per se.
Linus
By the way, a $5 one-transistor antenna may not be worth $20, but some folks find a use for it. I guess they can't or won't build a simple passive wire antenna, but that's their choice. That's why there are companies like DWM.

Try Walt Williams, W5YUO. He also has another guy making them
but I've forgotten his name. If he doesn't have what you want, he'll
make it, literally anything.
'Doc

Monkey Made Antennas from http://www.antennawarehouse.com/

Get a MM-7 Mount it on a bed tool box that is well bonded to the truck.
Coil of MM-7 Should be above Truck cab roof.

Or get Two MM-7s, Mount them on steel platforms built up from the bed,
or on channel iron placed across the bed so coils are above the roof
line. Space platforms 1/8 of a wave length apart front to back. Feed
one antenna 135 degrees out of phase (L networks). Killer in-line array

> promotes a good solution for a mobile set up with out a lot of drain
> on the electrical system.

The 80 isn't as good a value as the 225.
It's not that great a performer either.
A drawback to the 225 is that it has a
sideband delay that can't be switched
out. If you're using an AM-only radio,
have the seller defeat the sideband delay
prior to shipping. The procedure only
takes a couple of minutes (cut a PC board
trace with a hobby knife) and should be
free. If you're using a radio with sideband,
get one of the XL series Blue Face amps.
(The Palomar 225 and 80 and low-end Blue Face
amps.) The 350 is the most popular XL series
unit. There is a very quick and simple bias
reduction mod that can be done to the 350s
that increases the reliability by making the
amp run cooler and making it less likely to
damage transistors due to thermal runaway
when the amp is hot. It's even easier and
quicker than the 225 mod. I don't know if
Coaxkid is aware of it or not. If not, it's
something you can easily do yourself with
my help.

> I am new to linears and was wondering what I
> might expect in performance enhancements.

If you use a 225 or a 350, expect 2 to 3 times
your current range.

> I know terrain and other
> factors can make a difference. Any help the group can offer would be
> appreciated.

One other thing you need to deal with is that
the radio should be tuned to work with the amp.
These amps are easily overdriven if the carrier
(dead-key) power is more than about 3 watts.
The trick to getting the most out of the amp is
to tune the radio to dead-key at 2 to 2.5 watts
yet maintain the maximum peak (modulated) power.
Not every tech knows how to do that, so it's
important that you find one that does--otherwise
you could end up with unsatisfactory performance.

> 'Tis indeed sad when a young man of 50 years passes away. Not meaning any
> disrespect, but, who is Mr. Cheek?

Joe, this question is often asked, here is the standard response below.

Author: John Mackey, Jr (jmackey@usaXXX.net)
Amateur Radio Extra Class call sign KS0F

Bill Cheek was a man who lived near San Diego. He used to be active on
Fidonet but then had to leave due to reasons we won't speak of now. He
then became active on this NG & the internet but was again involved in
much trouble. Various problems with Mr. Cheek's action's
resulted in Peter Laws kicking him off of the "Scan-L" mailing list. More
similar problems with Mr. Cheek caused him to have his internet access
revoked by his Cable company ISP in summer 1998. In 1999 he was briefly
held by (federal) authorities and has been charged in (federal) courts with
various illegal actions in regards sales for the use of scanners. (He had
admitted to other legal problems in the past, also) He was the owner
& operator of a company called "Comtronics" & has produced a few books
based on information he had complied from various sources.

Despite various rumors, Mr. Cheek did NOT have any FCC issued licenses
within the last 15 years.

Mr. Cheek claimed to have been in the Army, others said he had been in Navy.
His rank or billet is unknown.

Mr. Cheek was well known by many for various reasons in the radio community.
Some people feel his technical knowledge was notable, some people feel
certain aspects of his personality were notable.

Due to mounting legal problems followed by health problems, in 1999 a
donation request was made to the general public to assist Mr. Cheek who
had no health insurance. His legal issues were being addressed by a public
defender.

Mr. Cheek was a smoker and died in July 2000 due to complications of Lung
and Brain Cancer.

He is survived by his wife Cindy and his children.

Mr. Cheek will be missed.

> allowable and max input to the amp??? using a grant LT stock.

What is the power transistor compliment of that unit?

M-650 sounds like it's patterned after the old M4Vs.
The M4V was a one-driving-eight using MRF455s.
The M-650 is probably the same except that it uses
the newer and more powerful SD1446 transistors.
The HD version probably doesn't have the driver stage.
If so, you won't see maximum power out of it with a
Grant as a driver. On the other hand, the amp will
have plenty of headroom, will sound good, and will
run cool. Without the transistor compliment I can
only guess. I'll assume it's a straight eight. If
that's the case, it'll stay linear no matter how the
Grant is tuned. In other words, no tricky tuning to
prevent dead-key overdrive is necessary. Just tune
the Grant to sound the way you want--the amp won't
change the sound because the entire input signal is
within the amplifier's linear (accurate without change)
transfer characteristic.

> what else do I
> need to know about setting up this system.

Messenger amps are usually pretty user friendly.
The regular techniques apply: use heavy DC wire
running straight to the battery (the ground too)
and a good antenna that's preferably not a mag-
mount. Put an SWR meter between the amp and the
antenna. Use a short jumper or a double-male
connector to get the SWR meter as close to the
amp's output connector as possible. Tune the
antenna for lowest SWR with the amp off. Then,
turn the amp on and recheck the SWR. Figure the
difference in SWR readings between tha amp off
and amp on conditions. A difference of half a
point or less is good (for example 1.2:1 with amp
off and 1.7:1 or less with amp on). A difference
of one and a half points is acceptable (for example
1.2:1 with amp off and 2.7:1 with amp on). If the
amp-on SWR is in the red (3:1 or higher) the amp

is unacceptably unstable and something will need
to be done about it. With a Messenger amp that
situation is unlikely unless there's a big problem
like a ground loop (because you didn't run the
ground wire to the battery) or a bad RF (antenna)
ground (because of using a mag-mount or not having
enough metal around the mount).

The way I look at it, in this modern age with all the choices, people who are concerned about their
communication being understood over airwaves, should take their own responsibility and encrypt their
information instead of relying on us (the scanner people) to have our devices crippled.

What are you trying to do? Impress us? I am not trying to rag on you
professor but it is obvious you do a lot of reading, nothing wrong with that
but you are the guy that posted a proud picture of an amplifier with just 1
transistor. Post a photo of an amp with a power splitter or a port. In the
process of putting it together you will figure out that the output of each
section before it enters the combiner is not a 50 ohm output. If you are
such the
"Amp Man" that you appear to be by your postings you should be able to
calculate the output impedance of each amplifier section before it enters
the combiner.
I am sure in posting this you wanted someone to argue with so their you go.

Selling an Eagle Spitfire 454 10 meter handheld radio. Unit is in like new condition. Features all mode (AM, FM, SSB) operation, 6 to 7 watts pep, external mic & speaker capability, mic gain adjust, offset transmit & receive with PL tones for repeater access, and 454 channels offering 25.165 mhz thru 29.655 mhz frequency coverage. Its basicly like a 2950 in a walky talky.

Paid $196 for the radio, and will sell for $100 plus $5 to ship anywhere in the united states. All accessories and manuals with original box included.

well my opinion is that was your first mistake, stay away from rad
shack except for the most mundane of supplies. question: is that a
high voltage switch on the front of that drake? i read that you can
modify that so there isn't that hv on that switch,......cd is out

yes 2 arms and 2 legs for about $10 worth of electronics and maybe $10 for
the case..
see when they made a copy they didn't know what certain components do so
there is no way to improve on them since they are just parts stuffers... I
have never had any problems with any type of noise out of daves regulators,
it is possible the alternator is causing noise... don't know how the
regulator would do this.... It is called suspended circuitry they are built
this way because it is fast and cheap to build and they work just as well
from what i have seen..

You got a squeel in your audio turn down your power key board or put the limiter back in you computer. You may also want to check the SWR between the tower and the moniter. Keep all your printer cables in wave intervales. Make sure your mouse is well grounded to the modem Ps opperating your computer out with a linear may be a violation of the FCC rules and regulation. 4-10?

4380. Re: Texas Star:EX 667V or EX 500V?

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: KW <killrwat@dwave.net>
Message-ID: <3984a624$0$8316$4bb17d6e@news.dwave.net>
Source record: 46385

The muffled sound you are referring to is typically caused by overdrive, The 667V will need to be driven very light to sound good, for me this drive level is typically 2 watts or less, I would rather run a DX500 and a ModV as a driver, I may get some arguements here, but here is how i think the MODV should be used as a driver.... The Variable control is made to direct a portion of the radios output to ground, all the Modv's I've run will show the radio a different impedance that will change as you vary the resistance by turning the control, if your radio has a built in swr meter or you inset one between the modv and the radio you can tune the control for minimum reflected power, then I adjust the output of the radio, typically to 1-2 watts, this method normally yields damn close to the same un-modulated carrier out of the modv as what the radio is set at.... A couple watts carrier and a nice healthy peak output level... This is usually how I drive the Sweet 16... I prefer the external driver, then you have a choice as to running the driver, or not... On SSB, running without the driver stage seems to produce a cleaner output... Maybe my response will yield some comments from some of the groups real amp Gurus..... The method works for me, but as always I'll listen to whatever anybody has to say.... If theres a better method I would certainly like to hear it!!

Yeah, I agree that they work just as well, however for what they charge for the things, a small circuit board would seem to be appropriate, If they had one etched in quantity they wouldn't add much to the overall cost, maybe a buck or so at most, then they could socket the regulator ic for easy replacment in case of failure, plus it would look a whole lot more professional......

4382. K1313 Base amplifier

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: maniac9188@aol.com
Message-ID: <20000730181350.29564.00001096@ng-co1.aol.com>
Source record: 46387

My friend is trying to sell me this base amplifier.... He hooked it up once, and was mad it was only doing 250W, so he put it back in the box, and is now selling it with an extra tube for $175... Do you think I should buy it?? I don't know about tube units... Thanks in advance.....
Maniac "373"

4383. marine radio?

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: Zane <zgorove@erols.com>
Message-ID: <3984D441.3C9CA6AD@some.com>
Source record: 46388

could marine radio be used like a mobile CB? What are the ramifications legal or otherwise? We would be operating well away from any body of water. what about a hand-held marine radio for hunting? any info on range or previous experience/problems would be appreciated.

4387. suggestions for an amp with 2960?

Newsgroup: rec.radio.cb
Date: 2000-07-30 00:00:00 UTC
From: lowrider <Ihate@spam.com>
Message-ID: <3984ad3e@dnews.gisco.net>
Source record: 46392

I have an RCI 2960 and since it has a built in linear I was wondering what my chances are of finding an amp that can handle being driven by this beast of a radio without getting an amp so big I need multiple batteries and altenators etc.

don't really want a huge setup but the 150-200 or so watts I get with radio isn't enough.

4388. call sign

try one of those contact/automotive points type files..theyre tiny and easy to bend to get in those tight spots if needed. received my set years ago as a gift, dont remember where from though. dont use anything too abrasive though. Ignore curious dan..his parents let him eat paint chips as a child. think the lead sank into his brain...You could try RatShack and see if they have anything, or try sandblasting some feeler gauges :) hehe

LOL

Ain't that the truth?!

Back in the middle sixties, the Mississippi State Sovereignty Commission (the state equivalent to the KuKluxKlans) used to tap the phones at a radical, revolutionary organization (the Wesley Foundation - United Methodist Church) where I occasionally stayed and we had more fun with the tappers than they did.

Of course, the Sovereignty Commission thought that they could learn all sorts of things about our radical (and probably communistic) methods but [sigh], the poor fellows forgot one very important thing: we were teenaged males and our phone calls had more to do with our girlfriends (or "potential" girlfriends) than it had to do with any sort of "subversive" activities.

Plus - because racists and other types of prejudiced "people" - are, basically, stupid (as "prejudice" always shows itself to be stupidity), the retards (as are all racists and any and all "people" who judge others by any other means other than as an individual and that individual's ethics and morality) were stupid. They didn'y know what a "ground" was and, so, everytime they activated their tap, they introduced a 60-cycle (as we said back then) hum.

We used ta dial the first number and then say, "I realize that racist oinkers are all virgins but if you pay attention, you'll be able to, at least, get a girl to go out with you". (or words to that effect)

[That was, of course, long before I realized that racists/sexists/prejudiced bigots all suffered from /really/ serious sexual problems and that we couldn't help them - that these people would all end up - sooner or later - in prison (which they might enjoy) or a mental hospital.]

I've always wanted to be blackmailed. I just want to get a decent price on the color, glossy, 8"x10"'s.

I think they would make GREAT holiday cards.

You'll probably not like this but, If you have problems with drifting and an unlocked clarifier you probably clipped D52 orD75,WRONG THING TO DO!!!! YOU JUST REMOVED THE TEMPERATURE SENSITIVE OR COMPENSATING DIODES..... NOT VERY SMART!! but its the way radio So called techs have been doing for years. Do a little research and find out that with a little rerouting the you can use D52 and D75 and the VR inline and still get the slide you need. AND STILL HAVE A STABILE CLARIFIER; ALSO :Use pin 1 of the votage regulator instead of pin 3 like all of your BOOK MODS try to te

Blow air in is ok, but if you really want to cool it down mount a
fan on the heatsink blowing away from the heatsink using the
natural heat convection of a heatsink (heat seeks to a cooler
area, the end of the fins being cooler than the mounting of the
transistors)

There is 2 spreed coils in the rear of the radio; I have found
the factory spreads these, when they do it can cause the coil to
break its own solder joint. Close the coils, resolder them, and
check the tuning ciol solder joints too. If you have these
factory made cold solder joints it is causing a internal high swr
and will bleedover on everything. Re-tune complete RF and
ossilator section.

Hey... if you don't know... then don't answer.
Do you think we want to hear your dribble?

why would a amp with a built in driver give you problems? compared to any other... perhaps your radio is not tuned correctly...

"GT40 425HP" <gt40425hp@aol.com> wrote in message news:20000730094345.24419.00000751@ng-bj1.aol.com...

4435. Re: Texas Star:EX 667V or EX 500V?

Newsgroup: rec.radio.cb
Date: 2000-07-31 00:00:00 UTC
From: Toll Free <tollfree@bigradios.com>
Message-ID: <TPeh5.400084$MB.6282992@news6.giganews.com>
Source record: 46415

Built in drivers will ALWAYS make an amp more prone to being unstable, since the input and output are IN PHASE.

one mod I recomment on those types of amps is to move the input and output coax jacks as far away from each other as possible.

The 667 is a nice amp. I have one. One thing I think Texas Star is OUT OF THEIR MIND for doing is the cheesy little wire that feeds the thing (rewire the input power wires with #6 guage, minimum), and kill those cheesy fuseholders.

Put a 80 to 100 amp fuse at the battery, and use #4 wire to feed the 667. Doing that will allow 300 watts RMS out of it, and peaks from 800 to a little under a thousand watts (depending on what your power supply (alternator / battery) can supply under 120 amp load).

Hope this helps.

Guess so Bill, they must be happy making it how they are..... They
would save money by adding a board, assembly would be quicker, they would
save wages on the stuffers....... But like you said..........

4437. Re: Galaxy 959 Any good ?

Newsgroup: rec.radio.cb
Date: 2000-07-31 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <20000731100109.25756.00001023@ng-df1.aol.com>
Source record: 46417

The 959 is an excellent radio. I have one and I love it. It has to be the most radio for the buck you could ask for.
variable power, variable talkback, roger beep, freq. counter, big meter, automatic swr readings, SSB, and many other features that you would normally have to pay big bucks for on other radios.
Built on a excellent chassis! Nice, super clean audio.
There are many mods you can do to this radio. Panther Electronics has a total makeover kit that they do. I think I paid $45 for them to do the complete makeover which covers about six different mods not including the normal tune, peak and alignment. You can find out more at Pantherco.com
The upper and lower channels can be added, but unless you are pretty familiar with working on radios, I suggest you let Panther or someone else who is an expert to do this mod.
Hope this helps!

4438. Re: Power supply question

Newsgroup: rec.radio.cb
Date: 2000-07-31 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <20000731100636.25756.00001024@ng-df1.aol.com>
Source record: 46418

Not true with Express Electronics. Take for example; Copper sells the Galaxy 99V for $339. Express Electronics also sells it for $339. But, for $369 you can have them do the turbo mod. So, for $30 more you can have the radio tuned, peaked, aligned, converted, and more for the price of what most people sale the radio before any modifications.

4439. Re: Galaxy 99 Bleedover

Newsgroup: rec.radio.cb
Date: 2000-07-31 00:00:00 UTC
From: mobile51@aol.com
Message-ID: <20000731101758.20961.00001900@ng-ch1.aol.com>
Source record: 46419

There is 2 spreed coils in the rear of the radio; I have found
the factory spreads these, when they do it can cause the coil to
break its own solder joint. Close the coils, resolder them, and
check the tuning ciol solder joints too. If you have these
factory made cold solder joints it is causing a internal high swr
and will bleedover on everything. Re-tune complete RF and
ossilator section.
Happy

.....
Its also possible that someone did the 50 ohm resistor/ diode swing mod which
will make it bleed like a bandit, but key lower and swing higher.

4440. Re: 23 channel-Crystal controlled Mods?

Newsgroup: rec.radio.cb

Change one of the crystals, which would give 4 extra channels. Which crystal frequency, I do not know.

For sale...

Texas Star DX 350 HDV Linear amplifier.
Features include...
AM/SSB switch, variable power control, Receive pre-amp.
Unit has an output power of 150 watts with a 4 watt drive,
I believe it will do more with a higher drive.
Unit works well and is in good shape.
$125.00 (includes shipping in the USA only)
Click here to see...

i have never ever had any problems running amps with built in drivers..
unless your talking about a 1x2x8 which would cause problems. But the
smaller ones 1x2's , 1x4's, and 2x4 never had a problem even at 21 volts
... Guess i don't know what i am doing ...

Has anyone ever been prosecuted for doing such? In a highly visible case, my congressman, John Boehner, was monitored on his cell phone and a tape of it was even given to a newspaper. No one was ever prosecuted even after Congressman Boehner's repeated requests.

IMHO, the law HAS been changed by the Justice Dept's failure to enforce it.

Toll,
I am surprised at your 120 amp load. I have a 667 that will do approx 800 watts on the bench and according to #12 it pulled 65 amps. I had Sean check it and the 800 was a good number but he couldn't measure the amp draw. Are #12's amp reading's off?

Yes, you can use marine VHF as you wish but the FCC won't share your
inclination to do so.
While the requirement for having a license for a mobile marine radio in an
aquatic application has been eliminated, you would still need a base license
for this purpose and would only be allowed to use the base to communicate with
other boats.
The marine radio service was named as such because it was designated for the
use of boaters. Land mobile uses are against the rules.
The ONLY exception to this is the FCC rule that states that one can use ANY
radio frequency or service, licensed or not, if life or property is immanent
danger.
If you have a marine handie with you while hunting and you or someone else gets
shot, it would be legal to use it to call for help. If you use it to tell your
hunting partner about the herd of deer that just walked past you, it would not
be legal.
If you decide to use VHF, keep your communications as short as possible to
hopefully avoid stiff FCC forfeitures.
Good luck.
Jeff

For myself, if all else fails, I use the fine emery from a brand new pack of matches on relay contacts and HEAVY DUTY rotary switches. If your switch is light duty, and you choose this method, BE VERY CAREFUL not to bend the movable contacts away from their stationary contacts.
Good luck.
Jeff

Professor, maybe you have seen a 2 to 1 and don't actually understand what you are looking at... .seems you read just enough to make you dangerous and not enough to actually understand ...

Lets take a look at a basic 4 pill You do not attach all 50 ohm impedances to the combiner, this is where you are cornfused,"the turns ratio of the output transformer of "most" 4 pills will make each 2 pill stage 100 ohms each", then when parralled togther thru the combiner you end up with your 50 ohms ... the amount of turns on the combiner gives you the isolation between ports, more turns more isolation.... .. that is why there is a combiner to transform the output impedance down to 50 ohms in a 4 pill .. Would this not be a 2 to 1 transformation? .

Using again 2 pill stages but this time with a different turns ratio on the output transformer making each stage 50 ohms ..now taking 2 - 50 ohm 2 pill stages a running them into a 2 port combiner/transformer makes them 25 ohms at this point now a LC network is used to transform/step it back to 25 ohms.....

I cannot speak for all amp makers but i do know who is doing it correctly ill save the rest for another post since i am sure you will have something to say after you read this ...

I am" The GAME"

If what you said here is true... then it would be ok... but I have a hard time believing that they are stepping the impedance up to 100 Ohms! That would be quite an impedance transformation all right. Their turns ratios do not indicate such a transformation. They are typically using at most a 9:1 ratio. This would make a 100 Ohm transformation look like 11 Ohms... very high for a push-pull combination where large devices are involved! It's more like 4-5 Ohms to be matched... If you were to do it that way you would have to have transformers capable of about a 25:1 ratio... or 5 turns. That's one of the main reasons those amps get so damn hot and are very inefficient!

First, I have no association with the company that you have mentioned.

Second, I can't say that you are wrong as I have no information about them.
I only have a some questions of logic concerning what you have writen.

First, if these people have the resources to gain information to harass people
as you say they do, It would seem that you are taking one heck of a chance
making these statements here while, at the same time, making your e-mail
address known to them at the top of your post. What happens if they track your
identity back to you by your e-mail address? Thank you for risking the supreme
sacrifice for all of us here.

Second, death by association because they advertise on this or that radio
station is a strange accusation.
Smart business people will shop around for the best price in advertising in the
particular market that they are trying to reach.
If you watch late night informericals on TV, there is ALWAYS a disclaimer that
the broadcaster is not responsible for the content or views of the commerical's
sponsor.This actually works both ways.
Just because they advertise on radical stations doesn't necessarily mean that
they are absorbing the station's political views into their business or that
their business supports the stations political position. The fact that the
station is still on the air means that they are staying within the bounds of
FCC regulation and their constitutionally protected right of free speech
regardless of whether we agree with their views or not.
I don't support terrorism or racism but I know people who are inclined to agree
with these idologies who would just as soon tell you that you are wrong for
supporting universal brotherhood.
As unpleasant as racist views are, unfortunatly, the Constitution tells us that
we don't have any more right to silence their voices as they have to tell us to
"stop preaching universal brotherhood".

Third, if they use their lawyers like weapons as you say, it would behoove you to apply for the witness protection program as they will probably be on the phone with them about you the minute they read your post.

Fourth, you suggest that we "contact them and let them know how we feel about the spamming...".
If they are as bad as you say, why in the world would ANYONE want to incur their wrath by complaning to them, about them???
Only a small portion of the population, as a whole, is truly suicidal. It is not our job to flag down the Flying Dutchman. They don't bury the scared, they bury the dead. I, for one, will not jepordize my family's safety or security for a private cause that doesn't concern me IF what you say is, in fact, true.

Fifth, if the rec.radio.etc. newsgroups have a problem with spamming, the owners DO have the ability to filter out the trouble makers by their screen names.
Apparently, they don't have a problem with what's being said.
I, however, have noticed that they, (the NG operators), have been quite tolerant of people who give their personal opinions of one another whether it be positive or negative. I have personal experience with this point as referenced to the flame wars that I and others were involved in 7 or 8 months ago.

Basically, what I'm trying to say is, your post screams, with great alarm, for credability and justice but really makes you sound like you are either exercising a dissatisified customer's vengence or a panic attack by someone who got his butt kicked on the shortwave newsgroup for whatever reason.

You could be entirely right in the things you say. I don't know. If you are, you are taking a hell of a chance in attacking such a dangerous organization as you say this one is.
On the other hand, if you fall into the catagory of the "dissatisfied customer" for whatever reason, you could become the legitimate target for their lawyers for posting the potentially liableous, (public slander in writing), accusations that you have made.
From what you have said in your post, if it were me, I would heed my own warnings and keep quiet if I actually believed what I was saying instead of broadcasting my whereabouts, through my e-mail address, to these "dangerous people".

Good luck and keep watching over your shoulder.
Jeff

I used to live 10 miles from the "world headquarters" of scientology in Clearwater Florida. When they first moved into the old Fort harrison Hotel in the middle 70's, everyone in Clearwater wondered why a "religion" would post guards armed with automatic weapons on the roof of their "church" while they were moving in. Then there were the people who went through garbage bins to find dirt on Clearwater city official to discredit the ones who opposed them. Ask Gabrieal Cezares. He was a city official who was attacked but came out on top. Check the archives from the St Petersburg, (Fla), Times from that time period for further information.
They moved in, in the middle 70's and only, in the last several years, won their "religious" tax exemption from the city of Clearwater, Pinellas County and the state of Florida but only after a lengthy court fight.
Now a days, they are puting out an air of good community citizenship while keeping a low profile.
Check the archives of the now defunked Clearwater Sun if available also.
Draw your own conclusions.

As far as disassociating himself from his "supporters".
Before I became permanently disabled, I worked for a world wide soft drink
company.
If, when I was on the net, they were to try to confine, control or restrict my
freedom of speech, I would become a major stockholder of that company through
the courts in short order.
Maybe this man realizes this and is trying to avoid such problems with his
"supporters". His "supporters" are the ones who are responsible for their own
actions.

>

Is he starting this again? Maybe I will have to come back here with my flame thrower and clean the weeds out of here again. It used to be that Gary and a few other of the ham channel masters would come in here and start plastering un-informed CBer's or outbanders for doing the things that most ham operators go to ham to get away from in the first place. Then these guys come back here and start to harass people when they should be on the ham NG's and "supporting" the ham cause. It was like the school bully coming to the class reunion and starting up his crap where he left off back in the 3rd grade.
If the need arises, I will spend some time here and clean up the yard and chase these channel masters back over to their side of the fence.
Jeff

I had a tri-mag mount and a francis grey ghost cb50.
8' Fiberglass antenna, which doesn't bend as bad as the 102' whip, in the wind.
My van looked like one of those bumper cars. It's alot cheaper than the wilson.
I did this usually on long trips via the hwy, locally I hit too many trees n stuff.
Locally I use the magmount wilson 1000.

If you want a hand held with more power than a frs radio, consider the dot radios that have 2 watts of power. They will reach better than the .3 to .5 watt frs radios. Most sporting good stors cary a version of them. So do the tool stores like Acme tool. They are pre programmed but the frequency can be changed via dip switches to other freq's. Cost is usually $100+ depending on quantity bought. I would only expect about 2-5 miles range with these depending on location and terrain.

It is illegal to use a radio for the taking of game (hunting). Around here, the wardens will confiscate them. (assume that is what you are using them for)

4495. Re: 23 channel-Crystal controlled Mods?

Newsgroup: rec.radio.cb
Date: 2000-07-31 00:00:00 UTC
From: Rosco <rvaagen@hotmail.com>
Message-ID: <socd0fpfdbm118@corp.supernews.com>
Source record: 46525

We used to change the oscillator crystals around. In the 23 channel rigs that had 12 crystals, we used to swap the l l.730 and 11.275 crystals around and it would put us in a band that was called the Oscar Meyer band. Channel 23 would be 26.800. In the 14 crystal rigs, we would swap the 4 tx with the 4 rx mixers and it would put us higher. I believe ch 19 was 27.505. I only did a couple of the 14 crystal rigs, but lots of the 23 channel rigs.

You will have to re-tune the radio's of course. You can split them for both bands by useing a toggle switch on the crystals, but you sacrifice both tx power and rx sensitivity.

In the 14 crystal rigs, there were 6 other crystals that were mixed with the tx and rx mixer freq's. One would be for channel 1-4, another for 5-8,ect.... well, we would pull out the ch 1-4 crystal and hook up a vfo in it's place. I had a Pal and a Siltronix vfo that would allow me to cover the entire 40 channels plus go up above to about 27.605. Those could be modified to give you more range also.

Have Fun

4497. Effecient and Good Mods for PC-66?

Newsgroup: rec.radio.cb
Date: 2000-07-31 00:00:00 UTC
From: Frizz <senorpurpl@hotmail.net>
Message-ID: <8m5dru$m2q$1@bob.news.rcn.net>
Source record: 46527

What can be done to this radio in ways of power and modulation (no limiter clipping)? I got this for free since it wasn't working (reverse polarity diode blown) and I fixed it but it is just sitting here. I really want to do something to it since I have been looking for a "tinker" radio and this is going to be it, I guess. Where can I find things to do with this?

Thanks!

4498. Re: what can i do for extra "punch"

Derek, I read through far too many responses to your initial question and although I didn't see too many that specifically addressed your question I also don't know about the rest as I stopped reading.

My contribution to this would be to forget the "PEAKing" of a radio unless you purchased it used and you have no idea of the previous owners. Now maybe I misinterpreted the meaning of Peaking but with any stock CB radio you can't expect to get too much in the way of power output with the standard finals and to change the finals to a more powerful transistor then that requires you to make sure you find a really good tech. The biggest bang for the buck you can achieve is to remove any type of modulation limiting circuit or clipping circuit but care must be taken as if you exceed the 100% envelope then your audio will distort more and that will sound terrible. Get as close to 100% modulation and ad a power (amplified) mic if you are in an enviornment which isn't too noisy. You will find that increasing your modulation to full modulation will much greater enhance your signal than trying to add a few more watts of power.

I can remember many years ago HyGain made a base station radio which was quite unique and had one of the best receivers I have ever seen on a CB Radio. I wonder if there are any of these still around.

Hello everyone. My deep cycle battery is on the way out and I
was
wondering where I could find a decent 75 amp, or so, power
supply. I
remember someone a few weeks back posted a site where they made
some
custom power supplies, I don't remember what it was so I wanted
to see
if you could make some suggestions for me. Thank you all in
advance.

Thats a pretty vague question, I would venture two guess' your could be referring to the Hygain 8 which was a 23, then later 40 channel AM/SSB base, it was about about 4 inches high with a sloped panel at the rear, controls were all on top and meter, channel selector etc., was on sloped portion.... Your most likely referring to the 623 Utopia, it was a Hybrid 23 channel am/ssb PLL controlled base, qite expensive in irs day, around 650.00 Very nice Audio, nice looking... I've seen both of them on Ebay for sale, the 8 seems to go for around 60-85 dollars, the Utopia has sold for 85-200 dollars.... Both can be found used with some effort.... Hygain has not made a CB for a number of years, when they did they made some neat items.... I can probably dig up some digital pics if you would like....

In the picture professor you will see a splitter, not a combiner. This is not the same type of splitter used by most of your amp builders. this type of splitter will allow you to insert multiple 50 ohm loads and end up with a 50 ohm output without using inductance to match the output. As much as you use CCS you ought to be able to build on just like the Henry in your picture, put your hands in more of them instead of reading and you to will learn that it is not always what you assume.

EFJ is offering the new version of qf3 but is charging more
I have a register copy under my name but i can't reinstall
because the security on this cd carl complaint that people
are making illegal copy but how many people use this program today not even
windows 2000 cd have so much security for"legal register user" i think legal
customer of this cd should have plenty use and reinstall of qf3 cd w/out
calling EFJ come on carl give me a brake
